1.0 Summary

This assessment report was prepared for **Stratton Resources Inc.** (“Stratton”) to document the 2012 exploration geochemistry and physical work programs on the advanced stage **MAC molybdenum-copper project (“MAC”)**.

MAC is located in the Omineca Mining Division of central British Columbia, Canada, approximately 75 km north-northeast of Burns Lake, B.C. and 80 km northwest of Fort St James, B.C. Stratton holds the MAC property through an option agreement and it consists of 70 contiguous mineral tenures covering an area of 24,670 hectares. Access to the property from Fort St. James or Burns Lake is by well-maintained Forest Service access roads.

Exploration at MAC has outlined significant porphyry molybdenum and copper mineralization in both alkali-rich intrusive rocks and hornfelsed volcanic rocks. The MAC mineral zones are best characterized as “quartz molybdenite veinlet stockwork” and in terms of host rock lithologies, alteration patterns and size, qualify as “Porphyry Mo (Low-F Type),” according to Sinclair (1995) in B.C. Mineral Deposit Profiles.

To date, three principal Mo-Cu enriched areas have been identified and variably drill tested: *Pond*, *Camp* and *Peak Zones*. The *Camp Zone* is the property’s most advanced target, having been the focus of the majority of drill testing. Exploration thus far has shown that the property’s priority porphyry-related mineralization is hosted in hornfelsed volcanic rocks and to a lesser extent, quartz monzonite intrusive. No intrusive lithologies have been identified at the Pond and Peak Zones.

The MAC property is underlain by rocks of the Cache Creek Terrane. The central portion of the property is underlain by greenstone, greenschist, gabbro and diorite of the Early Permian to Late Triassic Rubyrock Igneous Complex. Ultramafic rocks belonging to the late Pennsylvanian to Late Triassic Trembleur Ultramafite, and alkali-rich granitic rocks of the latest Jurassic to Early Cretaceous Francois Lake Suite of the Endako Batholith, intrude the Rubyrock Complex in the vicinity of the MAC molybdenum and copper occurrence. These alkali-rich intrusions, which are part of the Francois Lake Intrusive Suite, also host the Endako porphyry molybdenum deposit in the Fraser Lake area, approximately 90 km south-southeast of MAC.

MAC was staked in 1982 by Rio Algom Exploration Inc. (then Riocanex) following the discovery of molybdenum mineralization in float. In 1983 and 1984, Rio Algom conducted geochemical and geophysical surveys, geological mapping and trenching which resulted in the discovery of a stock-like body of quartz monzonite underlying what is now known as the Camp Zone, plus two peripheral anomalous zones, the Pond and Peak Zones. No further work was done on MAC until 1989, when Rio Algom drilled 12 holes on the Camp Zone. In 1995, Spokane Resources Ltd. optioned the MAC property from Rio Algom and conducted several meaningful exploration programs during the period 1995 to 1997. The best available records indicate that Spokane conducted geochemical and geophysical surveys, geological mapping, prospecting and drilled 49 diamond drill holes, mostly directed at the Camp Zone (~ 10,818 m) resulting in the publishing of a historical resource estimate for the Camp Zone in 1997.

During 2011 Stratton acquired the property and conducted a 44 hole HQ diamond drilling program, totaling 10,067 m. The drilling was directed at the Camp Zone in order to verify and expand upon historical Mo-Cu mineralization. A resource estimate completed in May 2012 gives the Camp zone deposit 70,360,000 indicated tonnes grading 0.063% Mo and 0.100% Cu and 177,934,000 inferred tonnes grading 0.042% Mo and 0.050% Cu at a cut-off grade of 0.035% Mo.

In 2012 Stratton Resources Inc. conducted rock and soil sampling in two separate areas and harvesting timber from 450 m of drill trail access right-of-way. In the northwest area of the property prospecting and rock sampling focused on evaluating potential for ultramafic rocks along a 15 km strike length to host awaruite nickel-alloy mineralization. Of thirteen samples submitted for near-total nickel determinations, seven were also selected for Davis-tube magnetic separations and multi-element analyses. Anomalous magnetically separable nickel concentrations were reported. In a second area, south of the Camp zone deposit at the Peak zone, 733 grid soil samples were collected over the east contact area of a large quartz-monzonite body. A 1,200 m copper-molybdenum soil anomaly was identified that warrants follow-up diamond drill testing.

Total expenditures for the 2012 geochemical and physical work programs are \$126,955.

2.0 Introduction

Stratton Resources Inc. (“Stratton”), via an option agreement, holds an interest in the 24,670 hectare advanced stage MAC molybdenum and copper project situated about 80 km northwest of Fort St James or 90 km north of the Endako porphyry molybdenum deposit, in central British Columbia, Canada.

After acquiring the property in 2011 through the acquisition of AZ Copper Corp., a private company, Stratton completed 10,067 m of drilling in 44 diamond drill holes and a property wide airborne geophysical survey the same year. The drill program was completed on the previously discovered Northeast and East Contact areas of the Camp zone. The Peak zone immediately to the south was last drilled in 1996 and is where an unconfined drill intercept of 0.008 % Mo and 0.1 % Cu over 76 m was obtained. In 2012 Stratton focussed a multi-element soil sample program on confirming and expanding the Peak zone target.

Also in 2012, Stratton investigated the west and northwest areas of the property for ultramafic hosted nickel mineralization potential. As well the company completed clearing and harvesting of trees for drill trail access right-of-way towards the southern area of the Peak zone.

Stratton is a publicly traded company with shares trading on the TSX Venture Exchange (symbol SI), with an office at 700-1199 West Hastings Street, Vancouver, BC V6E 3T5. The former AZ Copper Corp., now Stratton Resources (Canada) Inc, is a private BC registered company and a wholly-owned subsidiary of Stratton.

All currencies are in Canadian dollar denominations and measurements are in metric units (unless noted otherwise). All report plan and geology maps are plotted in NAD 83, Zone 10 as UTM grid coordinates, metric base. All figures are plotted with North to the top of the page.

3.0 Area and Location

MAC is situated in central British Columbia, Canada in the Omineca Mining Division approximately 75 km north-northeast of Burns Lake, B.C. and 80 km northwest of Fort St James, B.C. (Figure 4.1). The project is centered at latitude 54° 55' 03" North and longitude 125° 35' 28" West or 333912E, 6088710N (Zone 10, NAD 83) within the area covered by topographic sheet NTS 93K/13 and on BCGS maps 93K.082, 93K.083, 93K.092 and 93K.093. The property stretches roughly 22 km north to south by about 8km east to west, covering approximately 18,949 hectares.

4.0 Claims and Title

MAC consists of 70 contiguous Mineral Titles Online (MTO) mineral tenures acquired either through option agreement or staking and encompasses an area of 18,949 hectares (Figure 4.2). Thirty-three of the claims are registered to Kelly B. Funk and held on behalf of private Alberta registered company 802213 AB Ltd., the beneficial owner of an undivided 100% interest in these claims. The remaining 34 claims are solely registered to Stratton Resources (Canada) Inc., a private BC registered company and wholly-owned subsidiary of Stratton. Table 4.2a lists the details of the property mineral tenures.

By virtue of the Mineral Tenure Act of the Province of British Columbia and the recently finalized property purchase agreement, Stratton has the right to access the land it legally owns for the purposes of conducting mineral exploration. The surface rights holder for the land covered by the MAC claims are property of the “Crown”, i.e. the Province of British Columbia (notwithstanding any ongoing First Nations treaty negotiations).

The property claims have a good standing date ranging from August 09, 2012 to August 11, 2014 prior to submittal of this assessment report. The mineral titles were acquired online and thus claim locations are determined as plotted on MTO maps. There are no claim posts or lines marking the location of the MTO claims on the ground.

NOTE: The claim information of Table 4.2 is not a legal title opinion but is a compilation of claims data based on the authors' review of the Government of British Columbia mineral rights inquiry website (Feb 1, 2013). The claims are located on BCGS Maps 93K.082, 93K.083, 93K.092 and 93K.093.

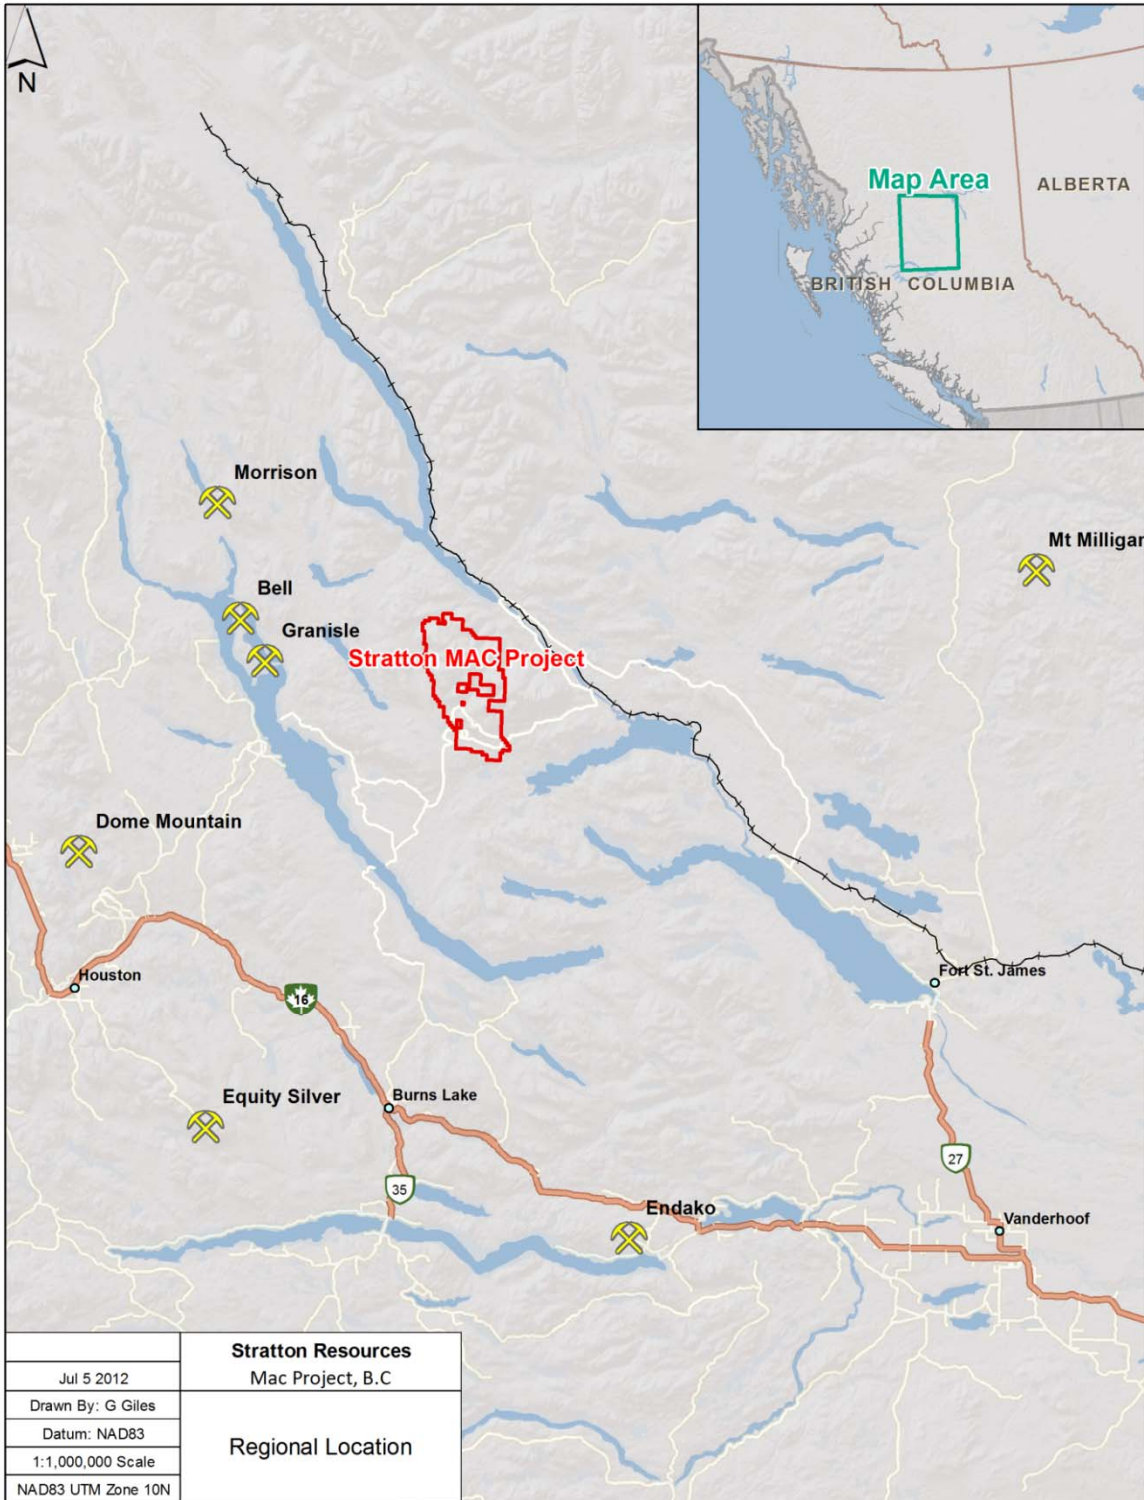

Figure 4.1 Location map

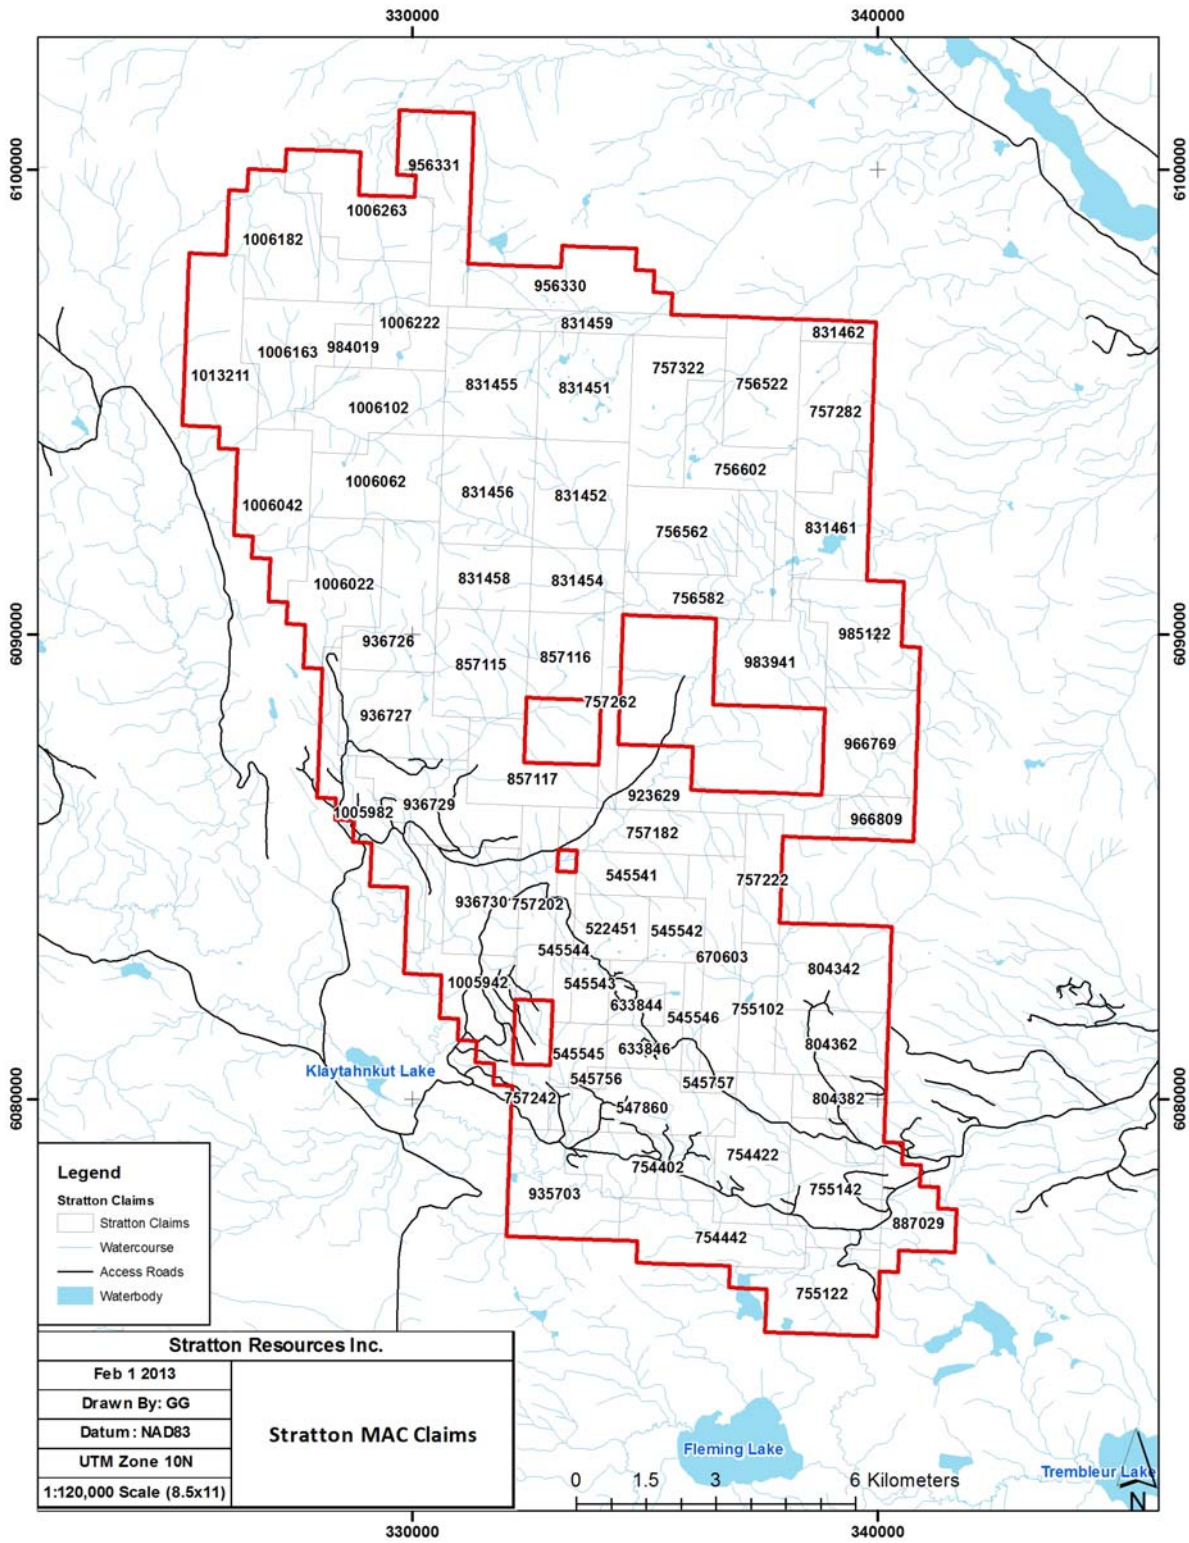

Figure 4.2 Claim map

Stratton (formerly Tribune Minerals Ltd.) entered into an agreement dated May 19, 2011 with AZ Copper Corp. whereby AZ Copper, pursuant to a statutory plan of arrangement, would be acquired by Stratton. The acquisition of AZ Copper was completed September 13, 2011 resulting in AZ Copper becoming a wholly-owned subsidiary of Stratton. AZ Copper subsequently changed its name to Stratton Resources (Canada) Inc.

Stratton Resources (Canada) Inc.(the “Optionee”) has an Option, dated for reference on May 4, 2010, with 802213 AB Ltd. (the “Optionor”) to acquire an undivided 90% interest in the 33 mineral claims listed in Table 4.2a, Part 1.

In order to fully exercise the 90% earn-in Option, Stratton must submit an aggregate of \$3.145 million cash payments and incur \$7.5 million in mining-work expenditures on the Property, as summarized in table 4.2b. The share issuances were completed by AZ Copper prior to Stratton’s acquisition.

Table 4.2b AZ Copper Corp Option Agreement

The Company can earn a 90% interest in the property by fulfilling the following requirements:

Date	Cash payments	Issuance common shares	Exploration Expenditures (cumulative)
May 4, 2010	\$145,000 (paid)	750,000 (issued)	-
November 30, 2010	-	4,250,000 (issued)	-
May 15, 2011	\$250,000 (paid)	-	-
November 15, 2011	\$250,000 (paid)	-	\$3,250,000(incurred)
May 15, 2012	\$250,000 (paid)	-	-
May 15, 2013	\$750,000	-	\$4,500,000
May 15, 2014	\$750,000	-	-
May 15, 2015	\$750,000	-	-
Total	\$3,145,000	5,000,000(issued)	\$7,750,000

If the project is advanced to Feasibility Study, then, if the Optionor elects not to finance the 10% interest to commencement of commercial production or to find a suitable buyer for the 10% interest, then Stratton (the Optionee) may elect, at its option, to:

- A) purchase the 10% property interest at a price equal to 2/3 of the value of the 10% interest based upon a 5% discounted net present value report based upon proven and probable ore reserves as defined by a feasibility report pursuant to NI43-101 standards incorporating as a general guideline the historical resource estimates on the property;

or

- B) finance the 10% interest to commencement to commercial production with repayment terms to be negotiated on commercially reasonable terms provided that the Optionor shall have the right to participate in any production financing on the same terms as available to the Optionee should it elect to do so.

On commencement of commercial production, a 2% Net Smelter Royalty (“NSR”) will be payable to the Optionor. The NSR will extend for an area of influence extending 3 km from the Property boundary as defined at the effective date of the agreement provided any lands acquired within that area of influence are not presently owned 100% by the Optionor nor encumbered by a pre-existing royalty. The Optionor grants the Optionee the option to purchase one-half of the NSR (1%) for the sum of \$3 million dollars for the term of one year following commencement of commercial production.

If the Property has not achieved commencement of commercial production by May 15, 2017, then the Optionee must pay to the Optionor \$100,000 each year commencing on May 15, 2017 until commencement of commercial production.

4.1 Environmental Liability, Permits & Bonds

To the best of the authors’ knowledge, there are no known environmental liabilities on the property. An abandoned camp from prior property exploration, consisting of a collection of dilapidated wood structures, a few abandoned fuel drums, assorted discarded metal and glass, and historical drill core was partially reclaimed by Stratton in 2010. Stratton should complete this reclamation effort by removing the abandoned fuel drums, metal and glass debris and burn the wood waste. There are no mine workings, tailings ponds, waste deposits or other significant natural features on the claims that may impact future development of the property. No archaeological studies have been carried out at MAC.

In order to conduct work on the MAC property, Stratton must obtain permits from the BC Ministry of Energy, Mines and Petroleum Resources (“BCMEMP”). Stratton has received all necessary permits it needs in order to conduct the mineral exploration. The exploration permit (No. Mx-2-187) carries a reclamation bond totalling \$50,000 and with an expiry date of March 31, 2016. In addition, a License to Cut (No L 48949) has been issued to Stratton by the Nadina office of the British Columbia Ministry of Forests. The property lies within the Omineca Forest Region (Fort St. James District) and the Skeena Forestry Region (Nadina District) of the British Columbia Ministry of Forests.

There are no First Nations reserves located on or in immediate proximity of the MAC claims.

The property is located within an overlap area of the claimed traditional territories of the Tl’azt’en First Nation and the Lake Babine First Nation. Within the Tl’azt’en First Nation, the MAC property is within three family Keyoh areas. Keyohs are the traditional family areas within the First Nation for which the family head controlled traditional hunting, fishing and

gathering. These historic Keyohs are reflected in contemporary traplines registered to these families and surpass territorial claims.

Stratton has memorandum of understanding agreements (“MOUs”) in place with the two First Nations bands, Tl’azt’en and Lake Babine, and the three Keyoh holders. The MOUs set out a framework for how Stratton will interact with each group and express Stratton’s willingness to engage the First Nations to ensure exploration work is conducted in a manner that is mutually beneficial to all stakeholders.

5.0 Access, Climate, Local Resources, Infrastructure and Physiography

Access to the property is most easily gained by well-maintained forestry roads from Fort St. James, via either the Cunningham Road onto Babine Forest Products Road using Cunningham Road to Phantom Road to Fleming Road to Tildesley, or via Canfor Leo Creek 700 to 200 Forest Service Roads crossing from the Fort St. James Forest District into the Nadina Forest District. A network of secondary logging roads provides access to many areas of the property, particularly within the southern portion of the claims.

The area has a typical central interior climate characterized by a wide temperature range with warm summers, cold winters and moderate precipitation. At Burns Lake, the average annual temperatures are 16.6 degrees Celsius in summer and -11.7 degrees Celsius in winter, with annual rainfall averaging 29.1 cm and annual snowfall averaging 189.8 cm.

The property is generally snow-free from May to October. Normal surface programs should be completed during this period. Drilling can be completed 12 months of the year with adequate winter equipment and camp facilities.

During the 2011 field season, Stratton established a temporary base camp for operations with space for about 20 persons in a clear-cut just off of Km 26.5 of the Austin road. Communications, including satellite telephone and internet connections, are provided on site by linkage to Starlynx Communications. At the commencement of the 2011 field season, Stratton constructed a 12 km access road, including 7 km of new road and 5 km of rehabilitated road, from the exploration camp to the Camp Zone, the area of focus for the 2011 drilling campaign.

The most accessible major supply center is Fort St. James (population 5,000), 80 km to the southeast, where supplies and services adequate to explore the property can be found. The towns of Smithers (population 6,000) and Burns Lake (population 2,500) to the west and southwest, respectively, also provide a variety of services.

A skilled labour force for mining and exploration is available in Fort St. James, Smithers and Burns Lake as well as in a number of other surrounding communities.

Due to the moderate terrain, there exist ample areas on the property for all aspects of large mining operation, including adequate areas for plant, waste and tailings disposal, and other recovery designs. Water for mining purposes is abundant. The nearest power supply for a large mining operation is located at Granisle, approximately 40 km west of the property.

The property has generally moderate topography. Overall relief is about 900 m with elevations ranging from 800 to 1,600 m above sea level. Broad open meadows with grass and scrub brush occur adjacent to most streams. Ponds and swamps are common in flat-lying areas. Timber cover consists of mature spruce, lodgepole pine and balsam. Clear-cut logging has taken place in the lower third of the southern block of the property.

6.0 Exploration History

6.1 RIO ALGOM EXPLORATION INC: 1982-1984, 1989

In 1982, Rio Algom Exploration Inc. (then Riocanex Inc.) conducted a regional lake sediment sampling program in central British Columbia. During the course of this program, anomalous molybdenum-copper-silver values were detected in lake-bottom sediments of three adjacent lakes located within the southern portion of the current property. Rio Algom staked the original MAC claims when molybdenite-bearing quartz veins in altered quartz monzonite float was discovered and reconnaissance soil and silt sampling identified widespread anomalous molybdenum concentrations. There is no record of mineral exploration in the immediate vicinity of the MAC claims prior to 1982 (Game and Von Einsiedel 2011).

Work conducted by Rio Algom in the period May-July 1983 consisted of 2,198 grid soil samples, collected at 50 m intervals along north-south oriented lines spaced 150 m apart. Soil geochemistry and reconnaissance geological mapping was directed at locating the source of the mineralized float discovered in 1982. A stock-like body of quartz monzonite was discovered underlying what is now known as the Camp Zone. Grab samples taken from the intrusion yielded analysis of between 0.034% and 0.250% molybdenum. The soil survey outlined three large zones of >15 ppm molybdenum, one of which was centered over the intrusive body. The remaining two anomalous zones, the Pond and Peak Zones, were found to be underlain by hornfelsed and mineralized volcanic rocks.

From May to September 1984, further work by Rio Algom consisted of line cutting, soil and stream sediment sampling, ground magnetic surveys, trenching, geological mapping and rock geochemical sampling. A total of 376 soil samples were collected to close off anomalies delineated in 1983 in the Peak, Pond and Camp Zones. Ground magnetic surveys were conducted over all three zones. Approximately 80 line kilometres of field magnetic data was collected within an 11.5 square kilometre area. Broad magnetic anomalies were found to be coincident with distinct molybdenum and fluorine litho-geochemical anomalies for all three zones. Blasting of outcrop and hand trenching over the known Camp Zone was conducted in order to expose fresh, unleached mineralization. Molybdenum grades of up to 0.166% over three metres were obtained from the Camp Zone trenches. Geological mapping of the 1984 grid area was done at a scale of 1:5,000.

No further work was conducted until 1989 when during the period July to August Rio Algom drilled 12 diamond drill holes on the Camp Zone to test results of previous exploration work.

Holes 89-1 to 89-12 were completed comprising 1,488 m of BQ core. Drilling established the limits of the mineralized stock and discovered a higher grade mineralized halo in the hornfelsed volcanics surrounding the stock.

6.2 1995-1998: SPOKANE RESOURCES LTD.

Rio Algom did no additional work and in early 1995, Spokane Resources Ltd. (now Silvercorp Metals Inc.) signed an option to earn a 60% working interest in MAC from Rio Algom by spending two million dollars on exploration on the property. In June 1996, after earning a 60% working interest, Spokane acquired a 100% interest in MAC from Rio Algom via payment of 1.5 million shares.

During the period 1995 to 1997, Spokane Resources conducted several meaningful programs of exploration on the MAC claims. According to a June 2007 Silvercorp Metals Inc. news release (Marketwire, June 18, 2007), Silvercorp had completed 49 diamond drill holes totaling 10,818 m and 62 km of ground magnetic and IP geophysics as well as geological mapping, prospecting and geochemical sampling in the period 1995 to 1997.

In July to October 1995, Spokane Resources conducted extensive exploration at MAC (Goodall 1996). This work consisted of establishing 62 line km of grid, cutting some 54 km of line, geological mapping and prospecting, induced polarization and magnetometer surveys over 45.6 km of the grid and 11 BQ size diamond drill holes totaling 1,987.6 m. The induced polarization survey was designed to evaluate geochemical and geophysical anomalies previously outlined in the Pond and Peak Zones and allow for correlation to previously delineated mineralization at the Camp Zone. The pole-dipole array was used on the survey with an electrode spacing of 50 m. The Camp stock was found to be situated on the eastern flank of an ovate area of low chargeability and moderate-low resistivity. The Pond and Peak Zones were found to have similar geophysical signatures (Fox, 1995). Limited geological mapping and prospecting was conducted in the area of the Pond and Peak Zones. There is no record of the number of rock samples collected or any results reported. The 1,987.6 m, eleven-hole diamond drill program tested the three known zones of mineralization. One hole, 95-13, tested the Peak Zone; four holes, 95-14 to 95-17 tested the Camp Zone; and six holes, 95-18 to 95-23, are located on the Pond Zone. Core samples were analyzed by molybdenum and copper assay from the Peak and Camp Zone holes and by 32 element ICP on core from the Pond Zone holes.

Records of exploration conducted in 1996 by Spokane Resources are incomplete. Spokane filed assessment (AR 24,638) on nine (96-24 through to 96-32) NQWL size diamond drill holes, totaling 1,609.6 m, cored in February, 1996 (Fox, 1996a). Company news releases (Stockwatch; June 14, 1996, August 9, 1996, September 11, 1996, October 11, 1996, November 22, 1996 and December 13, 1996) report that Spokane also conducted detailed geological mapping of the Camp and Peak Zones, completed 36 km of induced polarization geophysics on the Camp and

Peak Zones and drilled a further 19 diamond drill holes, for a total of 28 holes in 1996. The 28 holes were drilled during several drilling campaigns in 1996 and were directed at the Camp Zone (21 holes), Peak Zone (3 holes) and one hole to the northwest of the Camp Zone to test an area with coincident high IP chargeability and anomalous copper geochemical concentrations. Core samples for holes 96-24 through to 96-32 were assayed for copper and molybdenum with select samples analyzed for precious metal and platinum group element concentrations (Fox, 1996b).

In 1997, Spokane Resources drill 9 NQ diameter diamond drill holes totaling about 2,581.1 m at the Camp Zone (DDH 97-52 to 97-60) (Goodall 1997). In February 1997, Spokane published a Camp Zone resource estimate (generated by Giroux Consultants) of 52,420,000 indicated tonnes and 7,520,000 inferred tonnes at an average grade of 0.072% Mo, all calculated at a cut-off grade of 0.04% Mo (Giroux and Moore 2012). All drill-hole data collected for this historical resource estimate pre-date NI 43-101 compliance.

6.3 2007-2009

No work was recorded on MAC until 2007, when a program of stream sediment sampling was conducted by Amarc Resources Ltd. on a large group of claims that included all of the southern block of the current MAC project area, with the exception of a small internal area that covered the Camp and Peak occurrences (Tenure Numbers 633844, 633846), and a portion of the western half of the northern block (AR 29,697). A total of 291 silt samples were collected from road accessible areas of the claims. Anomalous values for molybdenum, copper and zinc were detected with the most significant clusters of molybdenum and copper values occurring in creeks draining the area of the Camp and Peak occurrences and in an area about 2 to 3 km to the east of the Camp Zone, in the Paula Creek drainage (Ditson et al, 2008).

In September, 2009, the two claims (Tenure Numbers 633844 and 633846) that covered the Camp and Peak occurrences lapsed and were acquired via on-line staking by Kelly Funk.

6.4 2010-11: AZ COPPER

After obtaining the option on MAC in May 2010, AZ Copper began a process of geologic data compilation, core recovery and photo logging, and regional scale magnetic profiling of the property (Game, 2011).

AZ Copper commissioned a study of the regional magnetic data available for the MAC area from T.E. Pezzot (2010) of S.J. Geophysics Ltd. The study included coverage of the entire property and extended beyond for a more regional basis. Data was processed in Geosoft Oasis Montaj and the UBC Mag3D inversion algorithm. The magnetic response of the area maps a belt of greenstone and greenschist metamorphic rocks of the Ruby Creek Igneous Complex.

The three known mineralized zones of the property lie along the flank of a weak magnetic high lineation within this broad low trend. The magnetic data indicate that the host environment of the Camp Zone deposit extends for some 500 to 1,000 m southeast beyond the Peak Zone.

In late 2010, AZ Copper conducted fieldwork focused on the Camp Zone. The program included recovery and re-logging of the existing drill core to improve the geological database. Approximately 11,000 m of core was recovered, logged and photographed.

6.5 2011: STRATTON RESOURCES INC.

AZ Copper contracted Geotech Airborne Geophysics to conduct a 1,780.3 km property wide helicopter-borne Z-Axis Tipper EM (ZTEM) and aeromagnetic survey in August 2011 (Haslinger, 2012). Data from this survey was subsequently reprocessed and analysed for deposit related features (Giles, 2012).

In September 2011 privately owned AZ Copper merged with and became publicly listed as Stratton Resources Inc. During September to December 2011, Stratton completed a 44-hole diamond drill program, totalling 10,067 m of HQ- sized (63.5 mm) drill core, on the East and North-west contacts of the Camp Zone.

Table 6.1: MAC Drill Hole and Drill Metreage Historical Summary

Year	Company	DDH Labels	#DDH	Total metres
1989	Rio Algom Exploration	89-1 to 89-12	12	1,488 m
1995	Spokane Resources Ltd.	95-13 to 95-23	11	1,992 m
1996	Spokane Resources Ltd.	96-24 to 96-51	28	6,248 m
1997	Spokane Resources Ltd.	97-52 to 97-60	9	2,581 m
2011	Stratton Resources Inc.	MC1101 to 1144	44	10,067 m
Total			104	22,378 m

The 2011 drilling verified and expanded upon the results of historical drilling at the Camp Zone and provided and along with historical drill data was used to calculate a revised 43-101 compliant resource estimate by Giroux Consultants (Giroux and Moore 2012). This resource estimate, completed in May 2012, includes 70,360,000 indicated tonnes grading 0.063% Mo and 0.100% Cu and 177,934,000 inferred tonnes grading 0.042% Mo and 0.050% Cu at a cut-off grade of 0.035% Mo.

7.0 Geological Setting and Mineralization

7.1 REGIONAL GEOLOGY

The most recent work in the area was done as part of the joint Nechako Natmap project (Geology of the Babine Lake-Takla Lake Area, Central British Columbia, Shiarizza and MacIntyre, 1999). Previous geological work in the area was done by J.E. Armstrong (G.S.C. Memoir 252, Fort St. James Maparea, Cassiar and Coast District).

MAC lies primarily in Cache Creek Terrane (see Figure 7.1). The Cache Creek Terrane includes the Sitlika assemblage in the west and the Cache Creek Complex to the east. The Sitlika assemblage consists of Permo-Triassic bimodal volcanic rocks overlain by Upper Triassic to Lower Jurassic clastic sedimentary rocks. This assemblage is structurally overlain by a poorly dated, but partially age-equivalent ophiolitic sequence that forms the western part of the Cache Creek Complex. Eastern elements of the Cache Creek Complex include a Permian to Lower Jurassic succession of predominantly pelagic metasedimentary rocks and thick Pennsylvanian-Permian carbonate sequences associated with ocean island basalts. Structural imbrication of Cache Creek Terrane, across predominantly well-directed thrust faults, occurred in Early to Middle Jurassic time, and was approximately coincident with its amalgamation with the adjacent Stikine Terrane. (Patterson 1974)

Intrusive rocks are common in the region and belong to several distinct suites. Late Triassic-Early Jurassic and Middle Jurassic plutons assigned to the Topley and Spike Peak intrusive suites cut rocks of the Stikine Terrane, whereas the adjacent Cache Creek Terrane is host to at least three distinct plutonic suites of late Middle Jurassic, Late Jurassic-Early Cretaceous and Early Cretaceous age.

MAC is underlain by northwest trending rocks of the Cache Creek Terrane. The central portion of the property is underlain by the Early Permian to Late Triassic Rubyrock Igneous Complex of the Cache Creek Complex. This unit includes greenstone, greenschist, gabbro and diorite. Ultramafic rocks belonging to the Late Pennsylvanian to Late Triassic Trembleur Ultramafite, and alkali-rich granitic rocks of the latest Jurassic to Early Cretaceous Francois Lake Suite of the Endako Batholith, intrude the Rubyrock Complex in the vicinity of the MAC molybdenum occurrences. These alkali-rich intrusions, which are part of the latest Jurassic to earliest Cretaceous Francois Lake intrusive suite, also host the Endako porphyry molybdenum deposit in the Fraser Lake area, approximately 90 km south-southeast of MAC. Trembleur Ultramafite also occurs in the northern section, where it underlies the Tsitsutl Mountain chromite

occurrence. Greenstone, limestone and other sedimentary rocks of the Upper Pennsylvanian to Upper Jurassic Cache Creek Complex largely flank the central band of the Rubyrock Igneous Complex. These sedimentary rocks belong to the Sowchea Succession.

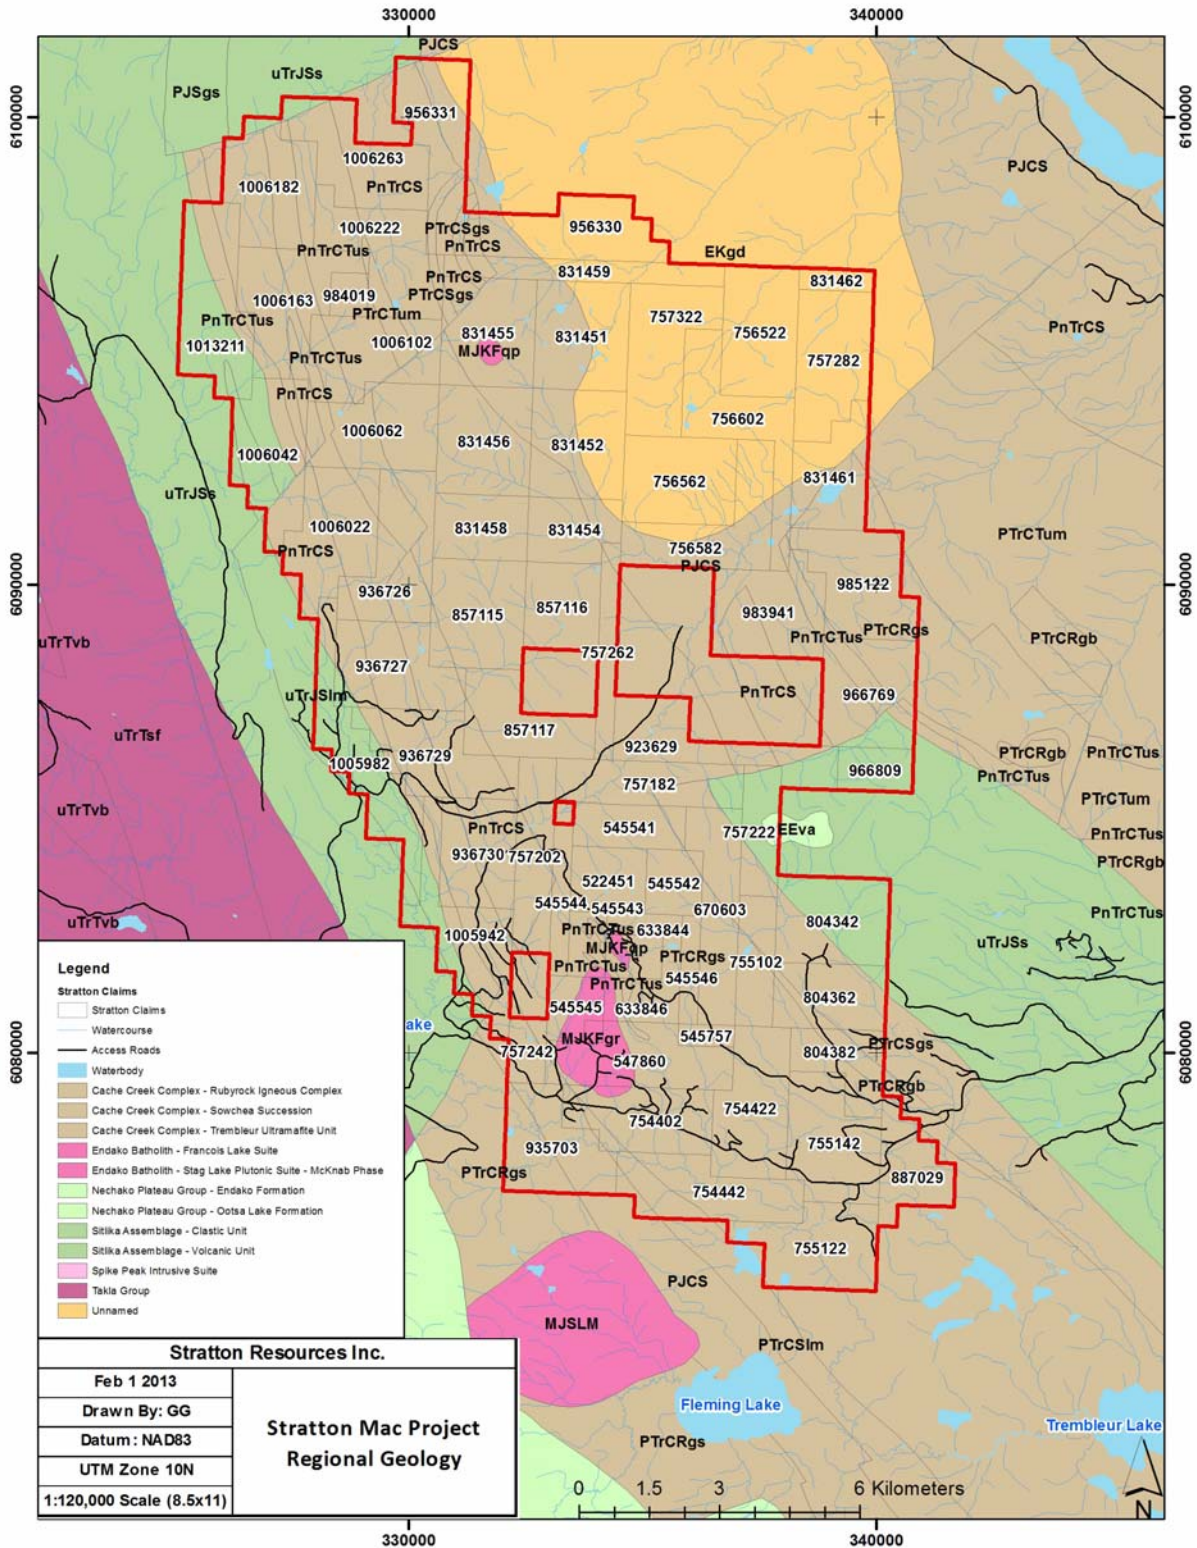

Figure 7.1 Regional Geology Map

Quartz diorite belonging to the Middle Jurassic Stag Lake plutonic Suite of the Endako Batholith intrudes Rubyrock Complex and Cache Creek sedimentary rocks near the southern edge of the property. A large Early Cretaceous granodiorite batholith intrudes Cache Creek sedimentary rocks to the north. Andesitic rocks of the Eocene to Oligocene Nechako Plateau Group occupy a large area southwest of the property, and are also present in a relatively small remnant overlying Sitlika rocks at the central west edge of the property.

7.2 PROPERTY GEOLOGY

7.2.1 Introduction

The following description of the geology of MAC is adapted from Fox (1996) and is based on mapping and drilling by Rio Algom in 1983, 1984 and 1989, work conducted by Fox Geological Services for Spokane Resources in 1995 and 1996, and drilling conducted by Stratton in 2011. MAC geology is shown in Figure 7.1.

7.2.2 General

McClintock (1983), Holmgren et al (1984) and Cope (1989) report that MAC is predominantly underlain by intermediate to basic volcanoclastic rocks which are correlative with the Mississippian – Triassic Cache Creek Group. These rocks are typically fine-grained and pale to dark green in colour. The volcanoclastic rocks are composed of intercalated massive fine tuff and fine to coarse lapilli tuff.

Angular lapilli are up to two centimetres across, comprise up to 80% of the fragmental layers and are surrounded by a fine matrix. Light to dark grey massive limestone is exposed in the northeast corner of the southern claim block. A moderate to intense regional foliation, trending 310 to 340 degrees and dipping steeply to the southwest, overprints the volcanic rocks. Where most intense, the resultant rock type is a pale green to grey–green chloritic phyllite with no evidence of original textures.

Numerous intrusions invade the layered rocks. The oldest is a dark green serpentinite forming northwest trending outcrops in the south–central portion of the property. The serpentinite is composed predominantly of radiating laths of tremolite and fibrous talc, and weathers to a distinct orange–buff colour. The serpentinite is assumed to be related to the Trembleur intrusions of Upper Paleozoic age. In the western and northwestern portion of the property strike lengths of up to 8 km of several 100's of metre widths of serpentinitized peridotite are mapped.

A 2.5 by 3 km stock of biotite–hornblende granodiorite is exposed in the southwestern portion of the claims. It is composed of pale yellow–white euhedral 1 to 3 mm feldspar phenocrysts, 1 to 2 mm biotite books and subhedral black hornblende crystals. Quartzphenocrysts to 8 mm

are common. A K-Ar date on biotite yielded a Lower Cretaceous age of 141 ± 5 million years (Godwin and Cann, 1985).

In the center of the claim block, a 500 m by 300 m stock of porphyritic quartz monzonite intruding Cache Creek rocks has been outlined. The southern end of the stock is truncated and possibly offset southeastward by a northwest trending, high-angle sinistral fault. Contacts with the surrounding hornfelsed volcanic rocks are not observed in outcrop. Observations from drill holes suggest the contacts are steeply dipping to vertical. The intrusion is medium grained, leucocratic and porphyritic to equigranular with 15 percent 1-3 mm feldspar, 25 percent 1-2 mm quartz, 35-45 percent 1-4 mm K-feldspar, and up to 5 percent biotite, muscovite and hornblende (Cope and Spence, 1995). A radiometric age of 136 ± 5 million years has been obtained (Godwin and Cann, 1985). Xenoliths of volcanic rock, a few centimetres to several metres in size, are found near the margins of the stock. Dykes of fine grained porphyritic quartz monzonite are common. The quartz monzonite body is host to stockwork quartz-molybdenite mineralization as discussed further below. Dykes of biotite-feldspar porphyry cut both the quartz monzonite stock and the host volcanic rocks. Generally these dykes are pale grey to tan, medium grained with conspicuous 1 to 2 mm biotite books. Locally the dykes are pegmatic with perthitic feldspar phenocrysts to 1 cm. These dykes tend to occur near the margins of the quartz monzonite stock, though not exclusively, and are variably altered and mineralized, and commonly occupy east-northeast trending faults.

The youngest intrusive on the property occurs as dykes of dark green, fine grained amygdaloidal andesite. Calcite-filled amygdules, 1 to 4 mm in diameter, constitute 5% of these rocks.

Soil and glacial cover is extensive and generally shallow, but includes locally deep mounds that can be over 5 metres thick, particularly in the river valleys. Overall bedrock exposure is poor to moderate but locally abundant in road cuts and in some stream gullies, as well as on steep upper slopes and ridge tops. Glacial striae of 105 degrees have been observed in outcrop on the property (Ditson et al., 2008), which agrees well with the local ice flow directions as shown in the published literature (Plouffe 1997).

7.2.3 Structure

As noted in section 7.2.2, a moderate to intense regional schistosity, trending 310 to 340 degrees, overprints the volcanic lithologies. Where schistosity is most intense, the volcanic rocks are altered to chloritic phyllites. The attitude of the volcanic rocks has not been determined due to masking of original textures in outcrop by the regional fabric.

A major through-going, northwest-trending fault, intersected in hole 89-6 and MC11-40 in the south-central portion of the claims, is expressed on surface as a strong topographic lineament. This fault truncates the southern end of the Camp Zone stock and it is interpreted that rocks to

the southwest of the fault are down-dropped. The fault lies along the contact between serpentine and the more competent surrounding volcanic lithologies.

7.2.4 Alteration

Regional greenschist grade metamorphism of the volcanic rocks has resulted in a dark green schistose rock with abundant chlorite and minor amounts of fine disseminated pyrite.

Hornfelsing along intrusive contacts has further altered the volcanics to dark, brownish-green massive rock with abundant biotite, amphibole and up to 5% fine pyrite. Where carbonate was present, lime silicates including epidote, garnet and possibly diopside were formed. In the hornfelsed volcanics, lens-like quartz sweats occur up to several metres thick. These sweats have sharp contacts and appear to pinch and swell. Alteration selvages, 2-3 cm on either side of the sweats, may contain wispy hydrothermal biotite.

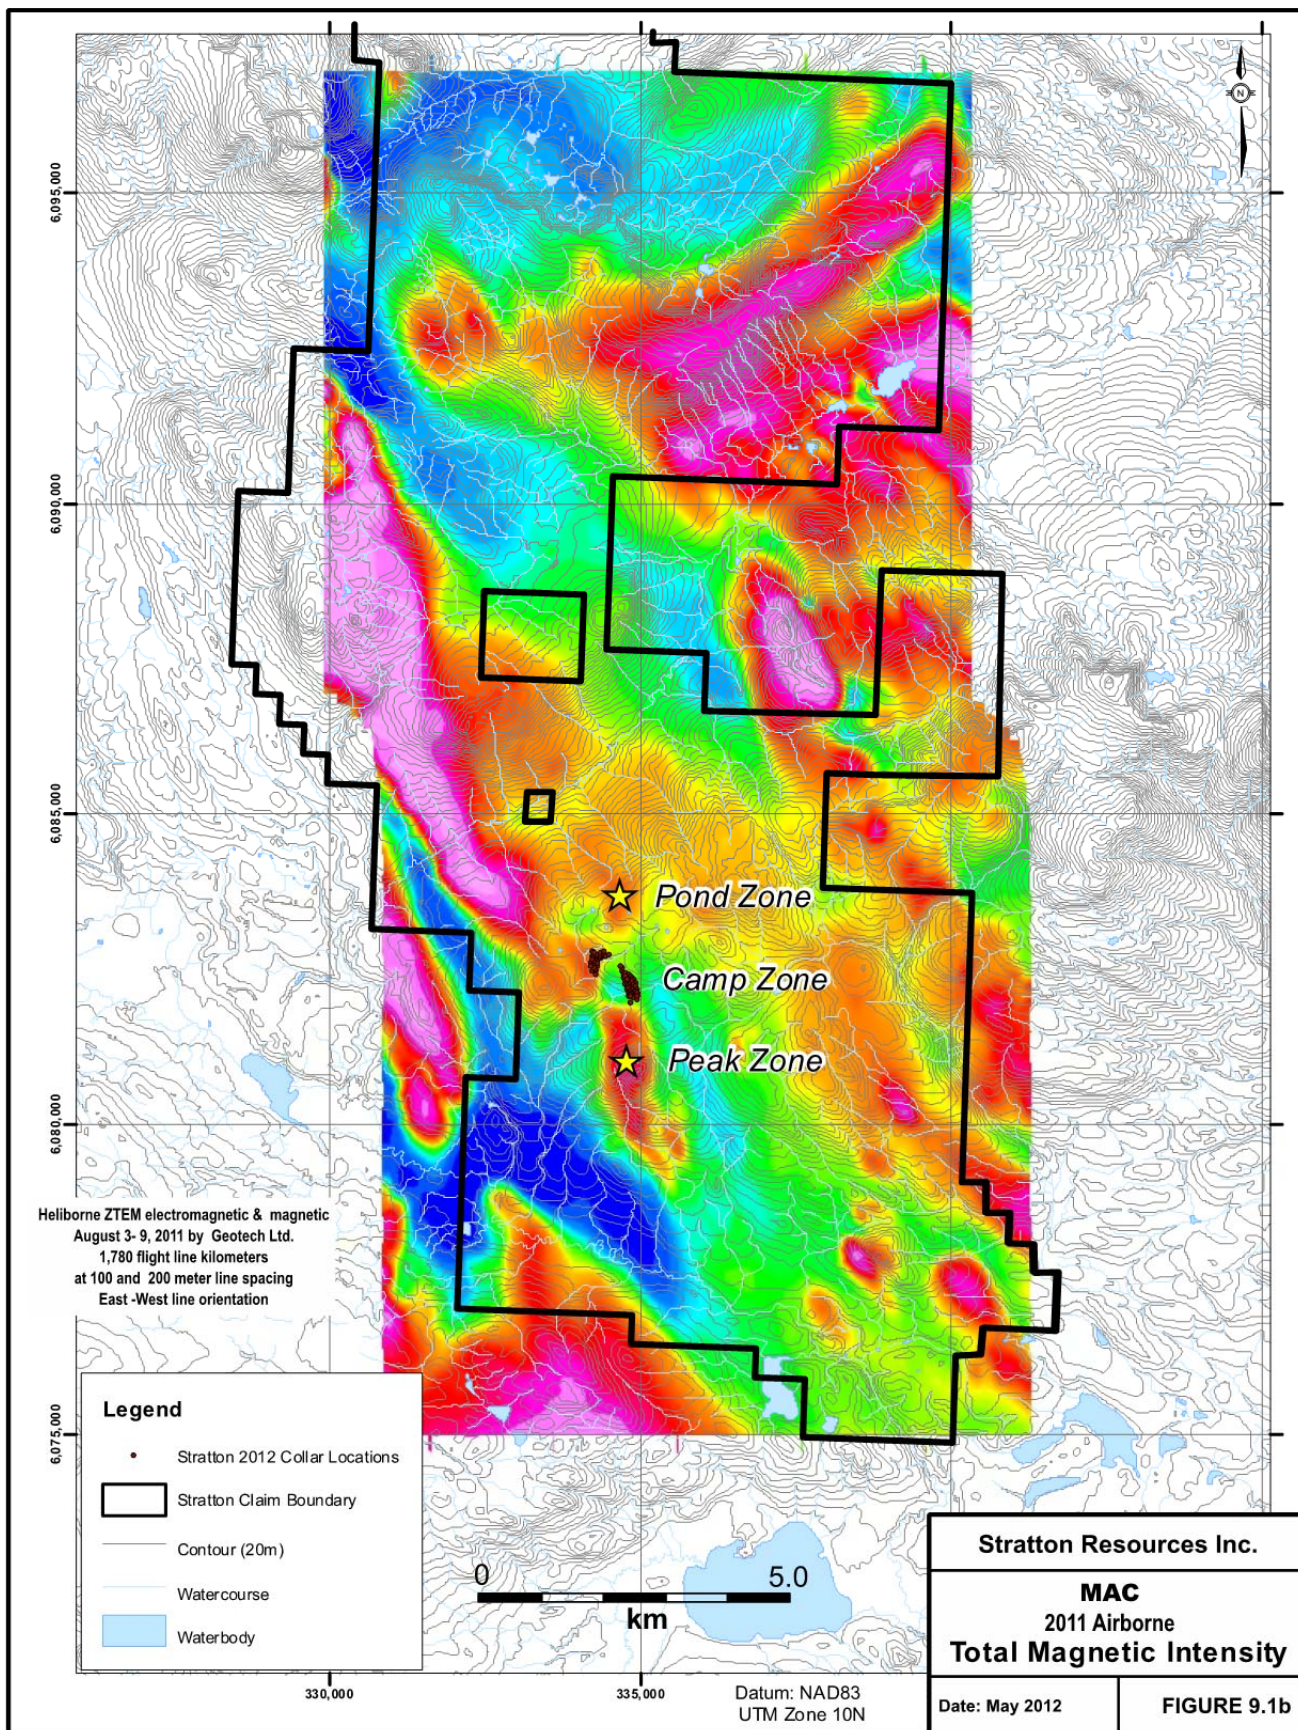

Hydrothermal alteration associated with intrusion of the quartz monzonite stock includes the development of a quartz stockwork, prominent secondary potassic feldspar flooding, pervasive sericitization of feldspar in the intrusive and development of lenses of quartz in the surrounding hornfelsed volcanics. Intense sericitization of feldspars within the quartz monzonite stock imparts a green tinge to the rock. This alteration appears to decrease in intensity with depth. Potassium feldspar alteration is limited in distribution and largely restricted to vein selvages in the quartz stockwork. Kaolinization has occurred along certain post-mineralization faults.

7.3 Mineralization

MAC mineralization is known to occur principally in association with a stockwork of quartz veins in the north extents of a 300 by 500 metre, northerly elongate, porphyritic quartz monzonite stock and with quartz veins and silicified zones in the proximal volcanics (Cope, 1989). The quartz stockwork is characterized by steeply dipping multi-directional quartz veinlets comprising up to 15% of the quartz monzonite stock. Vein widths are typically between 1 mm and 5 mm, but range up to 5 cm.

MAC molybdenum and copper mineralization occurs in three areas: the Camp, Pond and Peak Zones (see Figures 7.1 and 9.0). Historical and current drilling has mainly focused on the Camp Zone. The Camp Zone appears to form two lobes or lenses of better grade mineralization at the “East Contact Zone” and the “Northwest Contact Zone”, which are linked by a lower grade core zone of molybdenum mineralization within the quartz monzonite body. Coarse flaky molybdenite and molybdenite coatings occur along fractures and as vein selvages in the quartz monzonite stock. Molybdenite also occurs to a minor extent as fine disseminations and sparse, 1 millimeter rosettes. Where the quartz monzonite stock is exposed on surface, it is leached and

has only minor ferri-molybdenite staining on fractures. Molybdenum grades within the stock generally decrease with depth (Fox, 1996).

Quartz veins or sweats and cross-cutting quartz veinlets in volcanic rocks surrounding the Camp Zone carry fine disseminated and mm-scale wide, weakly laminated or banded molybdenite. Molybdenite mineralization extends outward for some 50 to 90 metres in a zone of biotite-bearing, hornfelsed rocks along the east, north and west contacts of the stock.

Chalcopyrite occurs primarily as disseminations in siliceous zones within the mineralized volcanics fringing the Camp Zone stock where two relatively copper-rich lobes of stockwork and dissemination have formed (Fox, 1996). Traces of fine-grained disseminated chalcopyrite also occur within the core of the Camp Zone quartz monzonite stock. Pyrite, as disseminations and fracture fillings, commonly exceeds 5% in the proximal volcanics. Background level for pyrite in the more distal volcanics is 2%. Disseminated pyrite within the quartz monzonite typically comprises less than 1%.

Limited historical drilling in the Pond and Peak Zones has intersected similar styles of mineralization in hornfelsed volcanic rocks as described for the Camp Zone. Grades for both zones are lower than observed in the Camp Zone, with the available records showing grades in the Pond Zone up to 0.024% molybdenum and 0.059% copper over 286.5 meters in hole 95-13 (Fox, 1996). Results for just one Peak Zone hole has been found and they record grades of 0.012% molybdenum and 0.016% copper over 196.6 metres in hole 95-18. An intrusive source for the mineralization in the Pond Zone has not been found (Goodall, 1996).

8.0 Deposit Type

The mineral zones explored at the MAC property are best characterized as “quartz molybdenite veinlet stockwork” and in terms of host rock lithologies, alteration patterns and size, qualify as “Porphyry Mo (Low-F-Type)” with related examples in B.C. such as the Endako mine, Boss Mountain and Adanac deposits (Sinclair, 1995).

Sinclair (1995), in B.C. Mineral Deposit Profiles describes “Porphyry Mo (Low-F-Type)” as a stockwork of molybdenite-bearing quartz veinlets and fractures in intermediate to felsic intrusive rocks and associated country rocks. Deposits are typically low grade but large and amenable to bulk mining methods. The tectonic setting is subduction zones related to arc-continent or continent-continent collision, in high level to subvolcanic felsic intrusive centres with multiple stages of intrusion. A variety of lithologies may be host rocks. Tuffs or other extrusive volcanic rocks may be associated with deposits related to subvolcanic intrusive rocks. Genetically related intrusive rocks range from granodiorite to granite and their fine grained equivalents, with quartz monzonite most common. The intrusive rocks are characterized by low fluorine contents (generally <0.1%F).

Molybdenite is the principal ore mineral, chalcopyrite is generally subordinate, and associated minerals include quartz, pyrite, magnetite, hematite, K-feldspar, biotite, sericite, clays, scheelite, tetrahedrite, galena, calcite and anhydrite. Ore is predominantly structurally controlled, mainly stockworks of crosscutting fractures and quartz veinlets, veins, vein sets and breccias. Alteration generally consists of a central core of potassic and silicic alteration, surrounded by or superimposed by a zone of phyllic alteration, giving way to an extensive zone of propylitic alteration, often overprinted by argillic alteration.

The genetic model involves multiple phases of felsic magmatic and associated hydrothermal activity during which highly saline fluids strip Mo, S and Fe from the magma, and deposit it as quartz, molybdenite and pyrite in breccias and fractures generated by pulses of intrusive activity and tectonism. Molybdenite skarns, and copper, tungsten, lead, zinc and silver-bearing veins may be peripherally associated with molybdenite stockworks.

Besides the MAC porphyry occurrences, there are three other minor Minfile occurrences located at MAC (Figure 7.1). They are:

- *093K 042; Tsitsutl Mountain Tin* is a narrow vein showing in metasedimentary rocks with minor tin, manganese, vanadium, cobalt, zinc and rhodonite. It is located in the northwest corner of the property.
- *093K 063; Tsitsutl Mountain* is a copper showing with minor amounts of disseminated pyrite and chalcopyrite in limestone near the contact with granitic rocks. It is located in the northwest corner of the property.
- *093K 067; Tsitsutl Mountain Chromium* is a small chromium showing where a 1.5 to 2.1 m long chromite lens is hosted in a serpentinite. It is located in the northwest corner of the property.

9.0 2012 Geochemical Sampling

Stratton investigated two different areas for two different mineralization styles in 2012. In July and later in the year prospecting and rock sampling was completed in the western and north western areas of the property for nickel mineralization while during July through September a soil sampling program was completed over and south of the Peak zone for Mo-Cu porphyry related mineralization.

9.1 Western Area Nickel Prospecting and Rock Sampling

A geophysical data analysis and interpretative assessment of the Stratton's 2011 MAC property ZTEM electromagnetic and magnetic airborne survey data was completed by Condor in early 2012 (Giles 2012). This work presents evidence for an effective approximately 5 km westward or left-lateral fault off-set of the northern strike extent of the serpentinized peridotite host to the Decar awaruite deposit. From regional and property airborne magnetic data, this shift results in some 15 km strike length of prospective ultramafic rocks lying in the north-west portion of the MAC property, north of the Camp zone deposit. Prospecting and sampling to locate and assess exposures of these ultramafic rocks was completed along logging road cuts, stream banks and ridges. In total some twenty exposures of potentially nickel-alloy bearing outcrops were located (Figure 9.1).

Detailed 15,000 scale plans with locations for the complete 2012 rock sampling are appended in Appendix 4

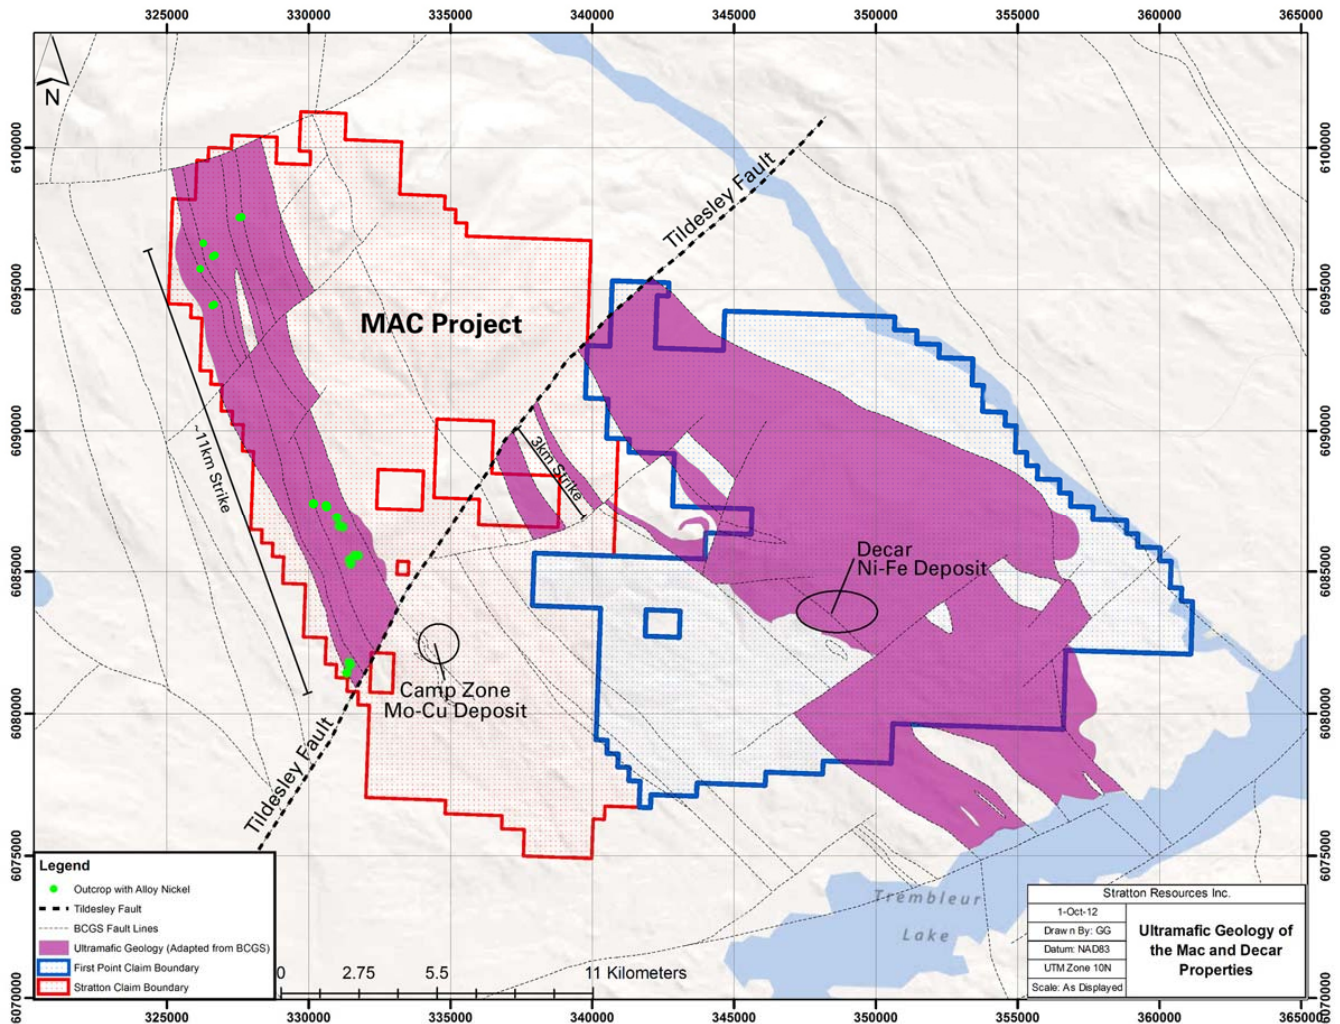

Figure 9.1 Ultramafic Geology of the MAC and Decar Properties.

Samples from thirteen of these were submitted for near total nickel determinations by four-acid (hydrochloric, nitric, perchloric and hydrofluoric acid) digestion and multi-element Inductively Coupled Plasma-Optical Emission Spectroscopy (ICP-OES) analyses at AGAT Laboratories in Mississauga, Ontario. Initial sample preparation was completed at AGAT's prep lab located in Terrace, BC. Sample collection and location data is tabulated in Appendix 1 and analytical results in Appendix 3.

A selection of seven of the highest nickel containing samples were processed through a Davis-tube magnetic mineral separation and then both magnetic and non-magnetic portions were also analysed by near-total four-acid digestion and multi-element ICP-OES, also at AGAT. Results are summarized in Table 9.1 below.

Table 9.1: Summary results of four-acid Digest – ICP-OES analysis of Davis-tube magnetically separated sample portions

Sample Description	Analyte:	Co	Cr	Cu	Fe	Ni	Magnetic portion recovered	Nickel recovered
Element concentration:		ppm	ppm	ppm	%	ppm	(%)	(%)
Detection limit:		0.5	0.5	0.5	0.01	0.5		
1584294 (magnetic)		286	16000	15.90	36.60	3710	10.10	0.037
1584294 (non-magnetic)		100	622	4.20	3.23	2010		
1584295 (magnetic)		324	6920	0.90	24.70	4160	5.80	0.024
1584295 (non-magnetic)		76	540	5.20	1.75	1740		
1584296 (magnetic)		270	12500	9.20	42.70	3740	6.70	0.025
1584296 (non-magnetic)		104	488	0.60	3.05	1970		
1584297 (magnetic)		182	18200	36.50	32.10	6370	8.00	0.051
1584297 (non-magnetic)		87	1070	<0.5	3.22	1660		
1584298 (magnetic)		228	7820	2.60	28.60	3020	4.10	0.012
1584298 (non-magnetic)		77	1160	<0.5	2.28	1800		
1584299 (magnetic)		287	10700	33.20	33.60	4060	9.30	0.038
1584299 (non-magnetic)		102	270	9.30	3.29	2090		
1584300 (magnetic)		162	10200	<0.5	34.00	2490	8.60	0.021
1584300 (non-magnetic)		92	582	<0.5	2.13	2000		
1584301 (magnetic)		276	13600	0.60	34.80	2780	0.00	0.000

Average of magnetic portion:		252	11993	14.13	33.39	3791	7.51	
Average Ni recovered by Davis-tube of the 7 samples reporting:								0.030

These results show higher nickel content with the magnetic fraction of the samples tested and hence indicate potential for this difference being due to nickel being present in its magnetic iron-alloy awaruite phase. These results also demonstrate the ability of a magnetic separation process to concentrate substantial concentrations of chromium and iron from these rocks as well.

Based on these results of probable anomalous concentrations of awaruite nickel-iron alloy along with strongly supporting chromium and iron, further mapping and sampling for centres of more strongly developed awaruite concentrations is warranted.

9.2 Peak Zone Area Soil Sampling

After review of Stratton’s 2011 drill findings in conjunction with review of previous drill results, the strongly anomalous intersect in hole 95-13 stands out as a prospective area for finding additional Mo-Cu mineralization through continued drilling. To help prepare for additional drilling in the area with soil geochemistry guidance, soil samples were collected in grid fashion

over the Peak zone and over some of its strike extension revealed in airborne magnetic data, Figure 9.2a.

A total of 733 samples were collected on east-west oriented lines spaced at 200 m with samples along the lines spaced at 25 m. Hand-held Garmin GPS units were used for locating and surveying each sample site. Samples were collected from below the organic bearing soil horizons, from the C-horizon – usually a basal till with clay matrix or colluvium. Samples were air dried for a few days prior to shipping to AGAT’s prep lab in Terrace where they were prepared for four-acid digestion and multi-element ICP-OES. Sample location data are tabulated in Appendix 2 and multi-element ICP analytical results in Appendix 3. For a selection of 50 of these samples with higher Mo and Cu results, an additional analysis for gold by aqua-regia digestion and ICP-OES was also completed.

Results of the soil sampling displayed and graphed by Mo and Cu element ranges are shown below in Figures 9.2a and 9.2b.

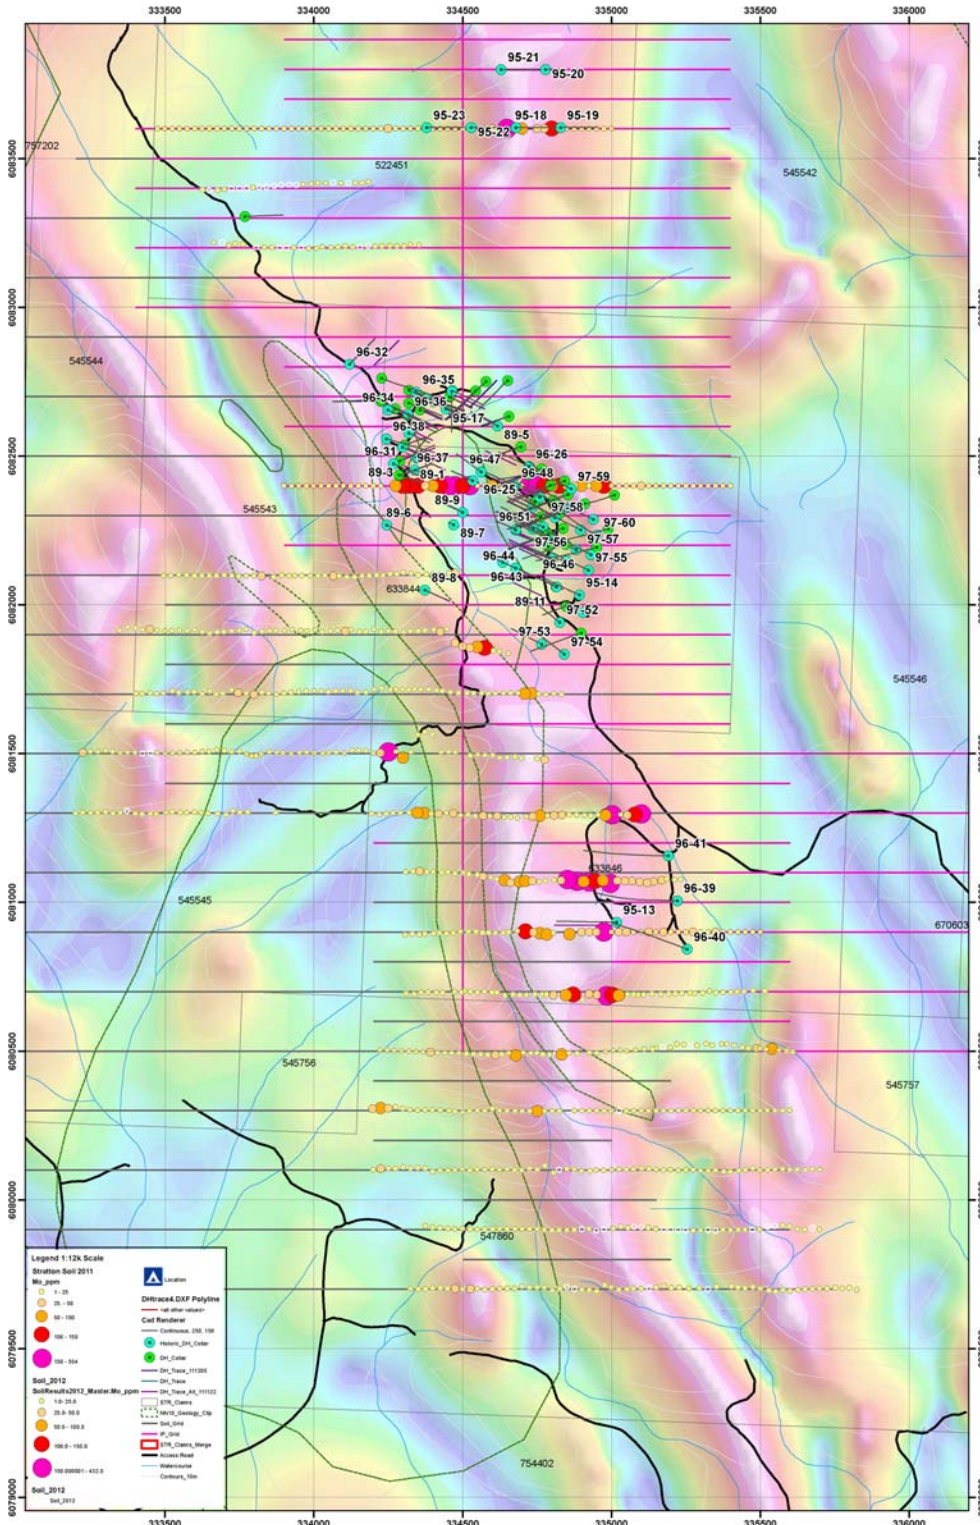

Figure 9.2a: MAC Camp and Peak Zone Mo Soil Geochemistry and Drilling

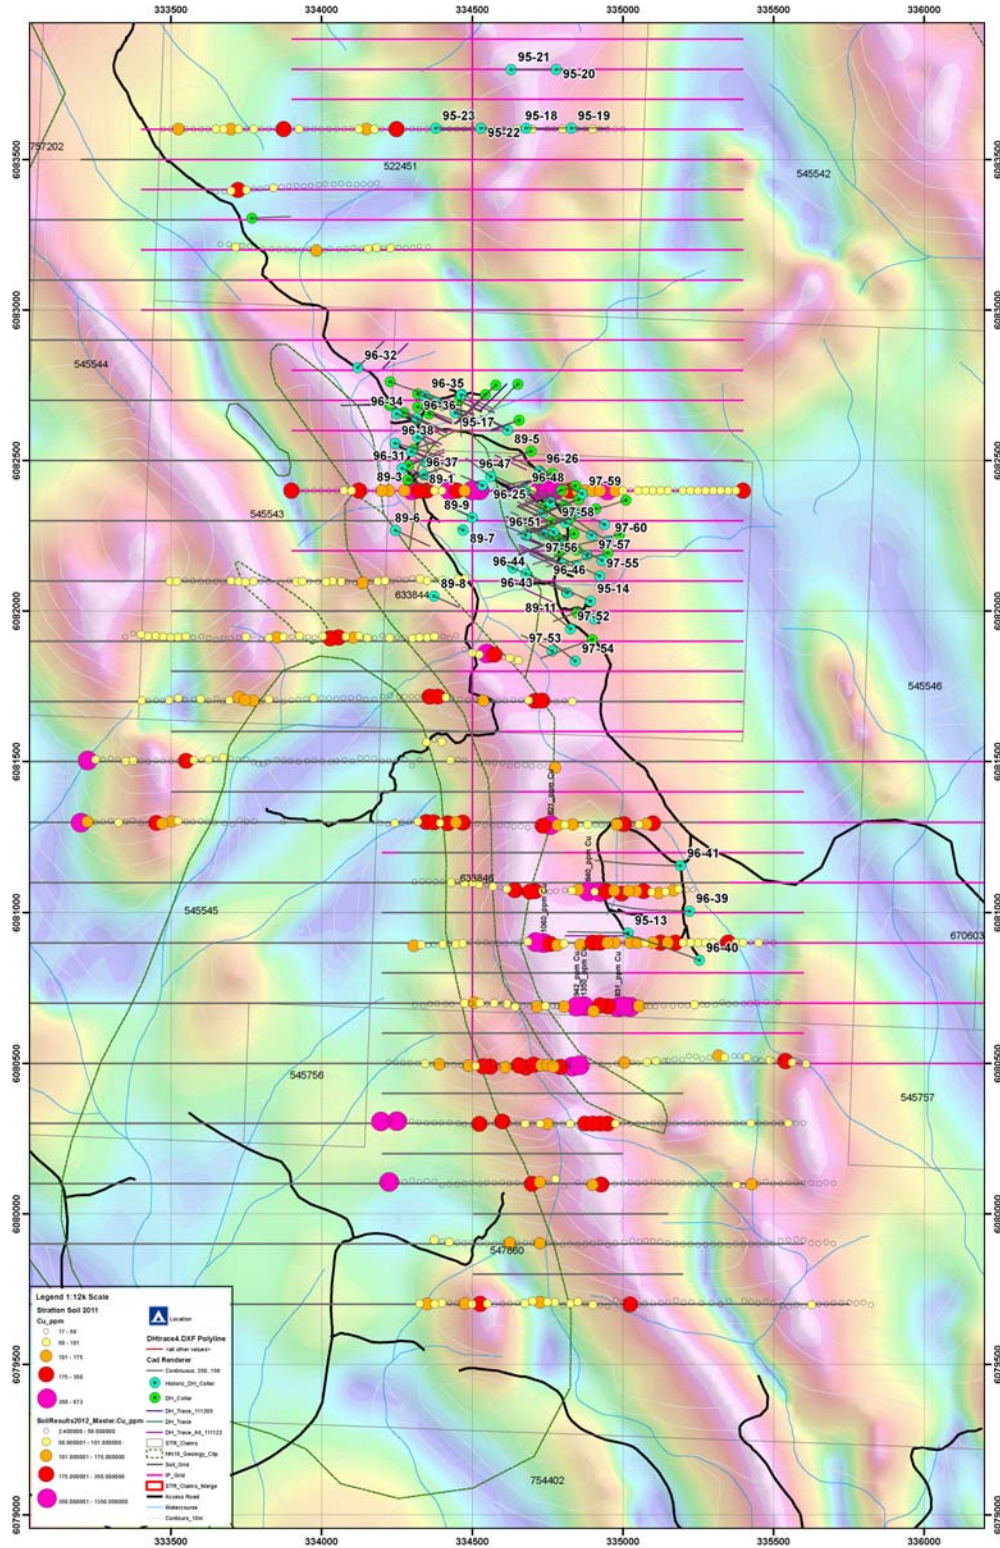

Figure 9.2b: MAC Camp and Peak Zone Mo Soil Geochemistry and Drilling

Detailed 1:5,000 scale plans with locations for the complete 2012 soil sampling are appended as Figures in Appendix 4

The distribution of higher concentrations of Mo and particular Cu appear to correlate with higher magnetic hornfels altered Cache Creek meta-volcanics and tuffs along the east contact of a large quartz-monzonite intrusion. This setting is similar to that of the Camp zone deposit mineralization just to the north. Elevated Cu and Mo occur in soil at the Peak zone over a 1200 m strike length and for some 400 m south of drill hole 95-13 . These results highlight potential in this area for future drill testing for till and colluvium masked Mo-Cu porphyry mineralization. Based on these results, a series of eight 250 m long diamond drill holes are proposed to test this area as shown in Figure 9.2c.

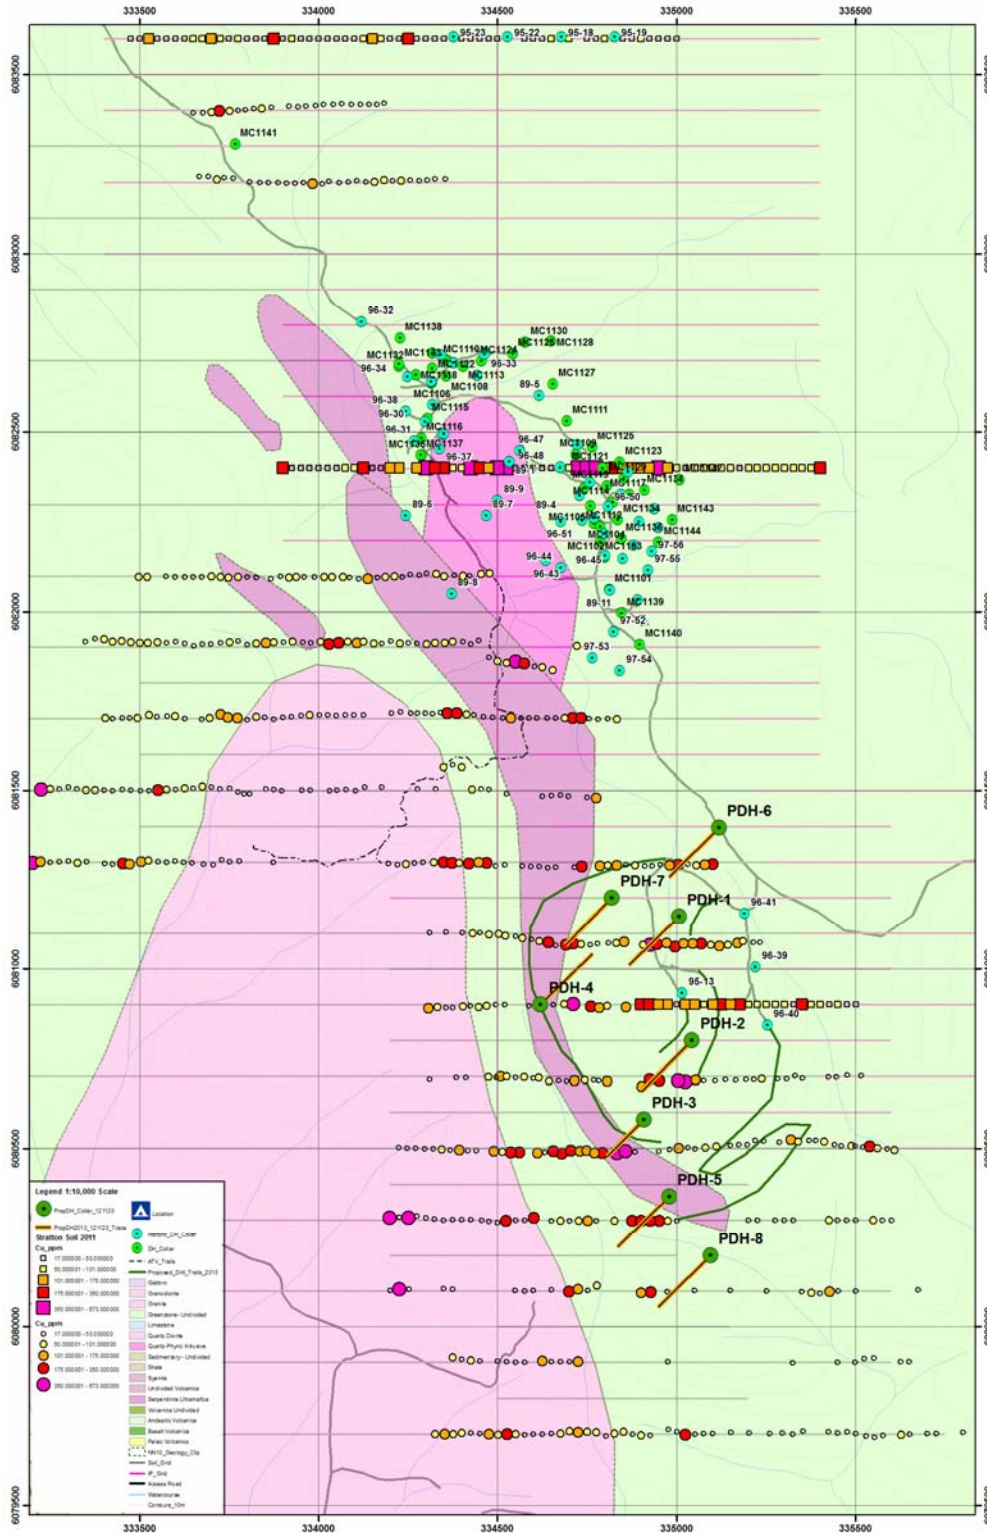

Figure 9.2c: Peak Zone Area Proposed Drilling to test anomalous Cu-Mo soil geochemistry

10.0 2012 Physical Work – Drill Access Trail Development

During November and December 2012 Stratton arranged with Flemming Creek Contracting of Burns Lake to clear access right-of-way and harvest timber from a 450 m long section of drill access trail. After being decked by faller-buncher, the spruce and pine dominant timber was skidded to a temporary landing area by grapple equipped D-7 dozer where it was loaded on trucks for transport to the Canfor mill at Houston.

This branch of drill trail access shown in the appended Figure 10.0, will be extended and completed for a proposed next phase of diamond drilling on the Peak zone.

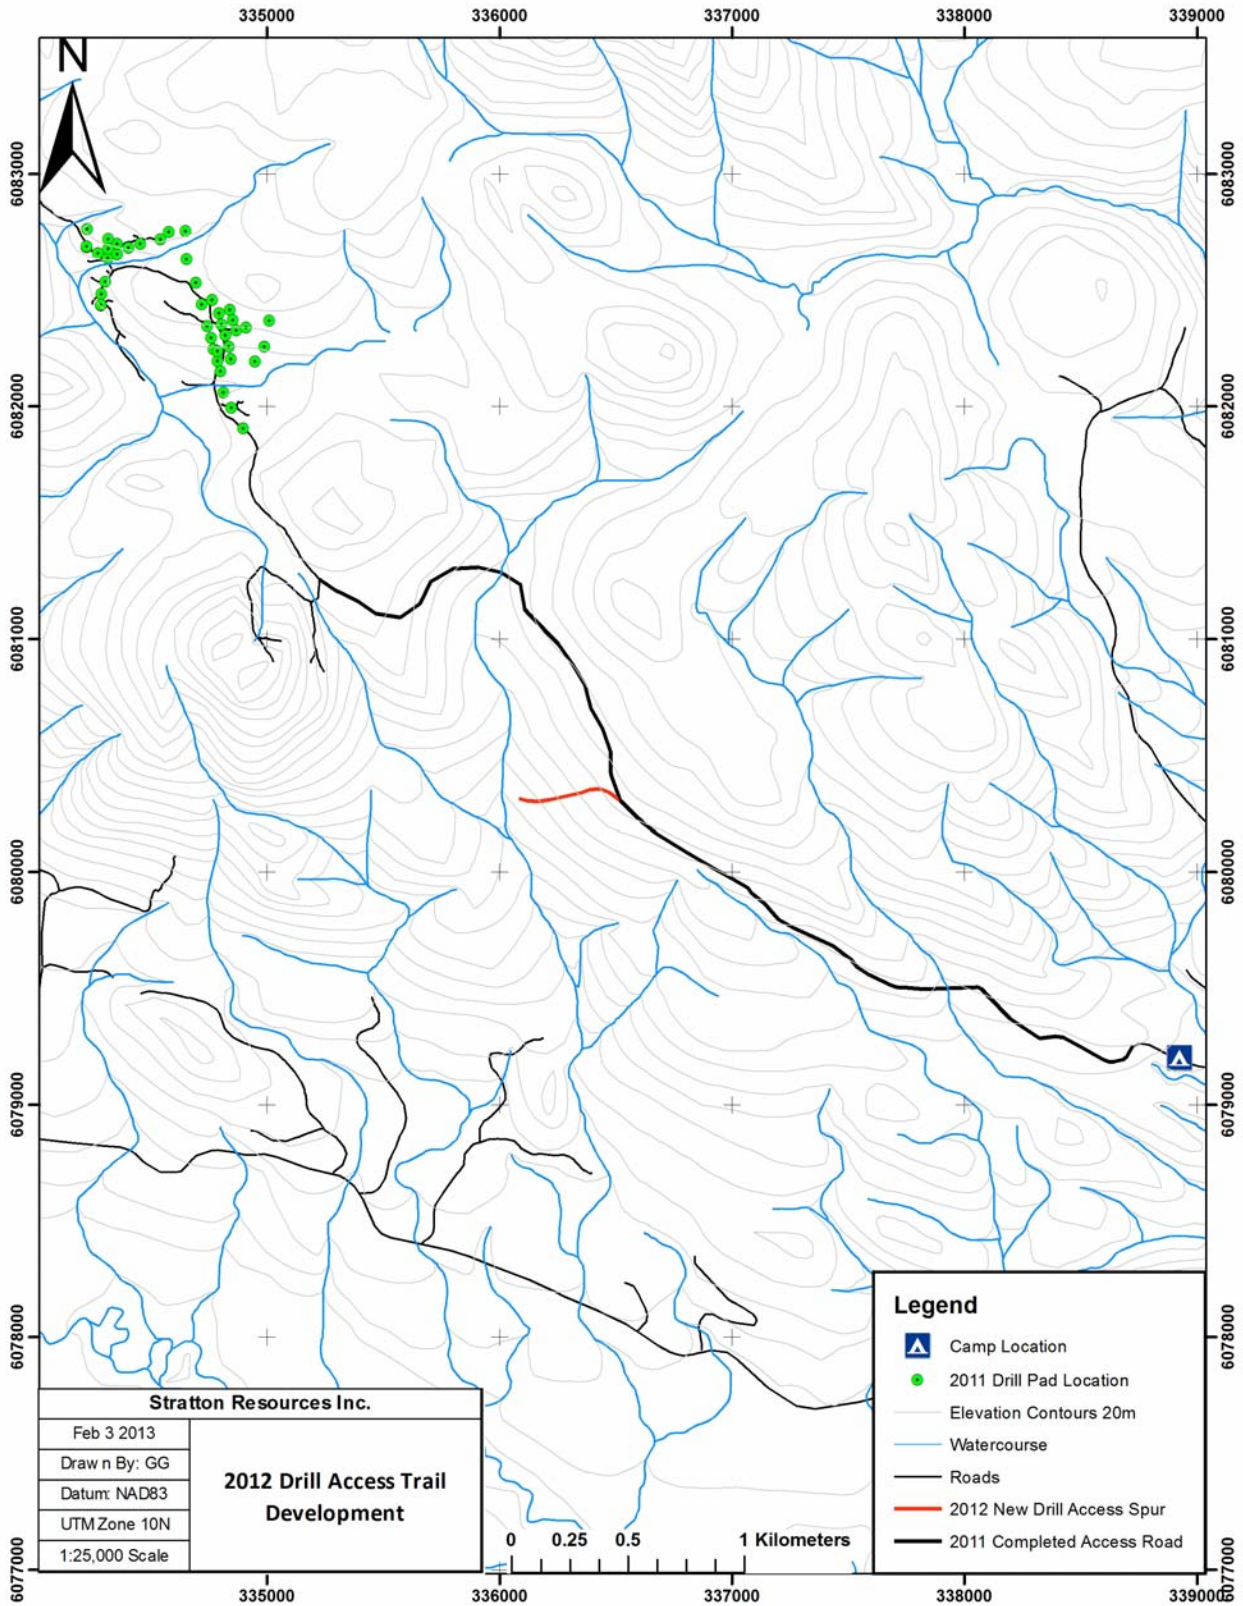

Figure 10.0: 2012 New Drill Access Trail

11.0 Interpretation and Conclusions

The results and findings of the MAC 2012 rock and soil sampling programs are several.

Rock sampling and prospecting that investigated the potential for the MAC property to host awaruite nickel-alloy in ultramafic was successful. Preliminary field work has confirmed the presence of magnetically separable nickel in serpentized peridotite. This is the same host unit as at the adjoining Decar property on the east side of the MAC property. These rocks are strongly magnetic and well traced by airborne magnetic surveys to extend over more than 15 km of strike in the north-west area of the MAC property. Substantially more geological mapping, prospecting and rock sampling are required to properly assess the economic potential for nickel mineralization in this area.

In the area of the Camp zone Mo-Cu porphyry deposit, 2012 soil geochemistry has highlighted a 1200 m long strike length of a quartz-monzonite intrusive body east margin that occurs at the Peak zone, on strike to the south-southeast of the Camp zone. The near ore-grade intercept in drill hole 95-13 lies along the trend of this anomalous soil geochemistry. Additional drilling is warranted in this area to fully test the intrusive contact zone west, south and north of hole 95-13. Eight 250 m long core holes are proposed.

12.0 Statement of Costs

MAC Property Assessment Expenditures for July 1 - December 31, 2012						
Exploration Work type						
Personnel - Position	Field Days	Days/Hours	Rate	unit	Subtotals	Totals
Richard Haslinger - Senior Geologist	July 1 to December 31	40	\$600	day	\$24,000	
Graham Giles - Senior Geologist	August 1 to September 1	30	\$600	day	\$18,000	
Herman George - Field Supervisor	October 1 to December 15	30	\$250	day	\$7,500	
Bryan Muloin - Field Supervisor	October 15 to December 1	30	\$250	day	\$7,500	
Gibert Muloin - Field Assistant	October 1 to December 15	15	\$200	day	\$3,000	\$60,000
		145				
Geochemical Analysis						
Rock samples - 43 element ICP-OES with Davis tube fractions for 8 selections		13 at \$20 and 8 at \$15			\$1,460	
Soil Samples - 43 element ICP-OES		733	\$20		\$14,660	\$16,120
Drill Site Access						
Access road and trails	450 m of drill site access right-of-way log harvesting by Fleming Creek Contracting				\$11,950	\$11,950
Transportation						
Airfare					\$2,850	
truck insurance, maintenance and repairs					\$5,950	
fuel					\$1,810	\$10,610
Accommodation & Food						
Camp and meals	by person days, support all	145	\$175	day	\$25,375	\$25,375
Communication						
Telephone	Satellite phone and internet				\$2,900	\$2,900
TOTAL Expenditures						\$126,955

16.0 Statements of Qualifications

I, RICHARD J. HASLINGER, P.Eng., do hereby certify that:

1. I am a Geological Engineer residing at 1245 Woodland Drive in Vancouver, V5L 3S2, British Columbia.
2. I graduated from the University of British Columbia with a Bachelor of Applied Science degree in Geological Engineering in 1986. I have practiced my profession continuously since 1986.
3. I am a registered member of the Association of Professional Engineers and Geoscientists of British Columbia, License Number 16798. My relevant experience includes mineral exploration and exploration project management on numerous projects in jurisdictions including Canada, United States, South and West Africa and Brazil.
4. I am responsible for preparation of the report titled, “*Geochemical and Physical Work Report on the MAC Property - 2012*”.
5. The information, opinions and recommendations in this report are based on my knowledge of the Mac Property through review of all available reports and data on the property and from overseeing and conducting exploration on the property during 2011 and 2012.
6. I am employed as Chief Operating Officer for Stratton Resources Inc., operator on the MAC Property.

Dated on January 31st, 2012 at Vancouver, BC, Canada.

(signed) R. J. Haslinger
Richard J. Haslinger, P.Eng.

I, GRAHAM D. GILES, G.I.T., do hereby certify that:

1. I am a Geologist residing at 9277 Braemoor Place in Burnaby, V5A 4E2, British Columbia.
2. I graduated from the University of British Columbia – Okanagan with a Bachelor of Science degree in Earth and Environmental Science in 2006. I have practiced my profession continuously since 2006.
3. I am a registered member of the Association of Professional Engineers and Geoscientists of British Columbia. My relevant experience includes mineral exploration and GIS management on projects in British Columbia, Ontario, Portugal and Ghana.
4. The information, opinions and recommendations in this report are based on my knowledge of the MAC Property through review of all available reports and data on the property and from conducting exploration work on the property in 2012.
5. I am employed as a Geologist and GIS Manager for Stratton Resources Inc., operator on the MAC Property.

Dated on January 31st, 2012 at Vancouver, BC, Canada.

(signed) G.D Giles
Graham D. Giles, G.I.T.

Appendix 3: Analytical Laboratory Certificates

- **Rock Samples**
- **Soil Samples**

CLIENT NAME: STRATTON RESOURCES INC.
700-1199 WEST HASTINGS STREET
Vancouver, BC V6E3T5
(604) 683-8193

ATTENTION TO: Richard Haslinger

PROJECT NO: Macni

AGAT WORK ORDER: 12D606165

SOLID ANALYSIS REVIEWED BY: Ron Cardinall, Certified Assayer - Director - Technical Services (Mining)

DATE REPORTED: Jul 03, 2012

PAGES (INCLUDING COVER): 13

Should you require any information regarding this analysis please contact your client services representative at (905) 501-9998

*NOTES

All samples are stored at no charge for 90 days. Please contact the lab if you require additional sample storage time.

4 Acid Digest - Metals Package, ICP-OES finish (201070)

DATE SAMPLED: Aug 24, 2012

DATE RECEIVED: Aug 24, 2012

DATE REPORTED: Oct 09, 2012

SAMPLE TYPE: Soil

Sample Description	Analyte:	Zn	Zr
	Unit:	ppm	ppm
	RDL:	0.5	5
121473		78.6	31
121474		96.6	28
121475		81.7	42

Comments: RDL - Reported Detection Limit

3644915-3645175 As, Sb values may be low due to digestion losses.

Method Summary

CLIENT NAME: STRATTON RESOURCES INC.

AGAT WORK ORDER: 12T653221

PROJECT NO: Au analysis for 12D634538

ATTENTION TO: RICHARD HASLINGER

PARAMETER	AGAT S.O.P	LITERATURE REFERENCE	ANALYTICAL TECHNIQUE
Solid Analysis			
Au	MIN-200-12006	BUGBEE, E: A Textbook of Fire Assaying	ICP-OES

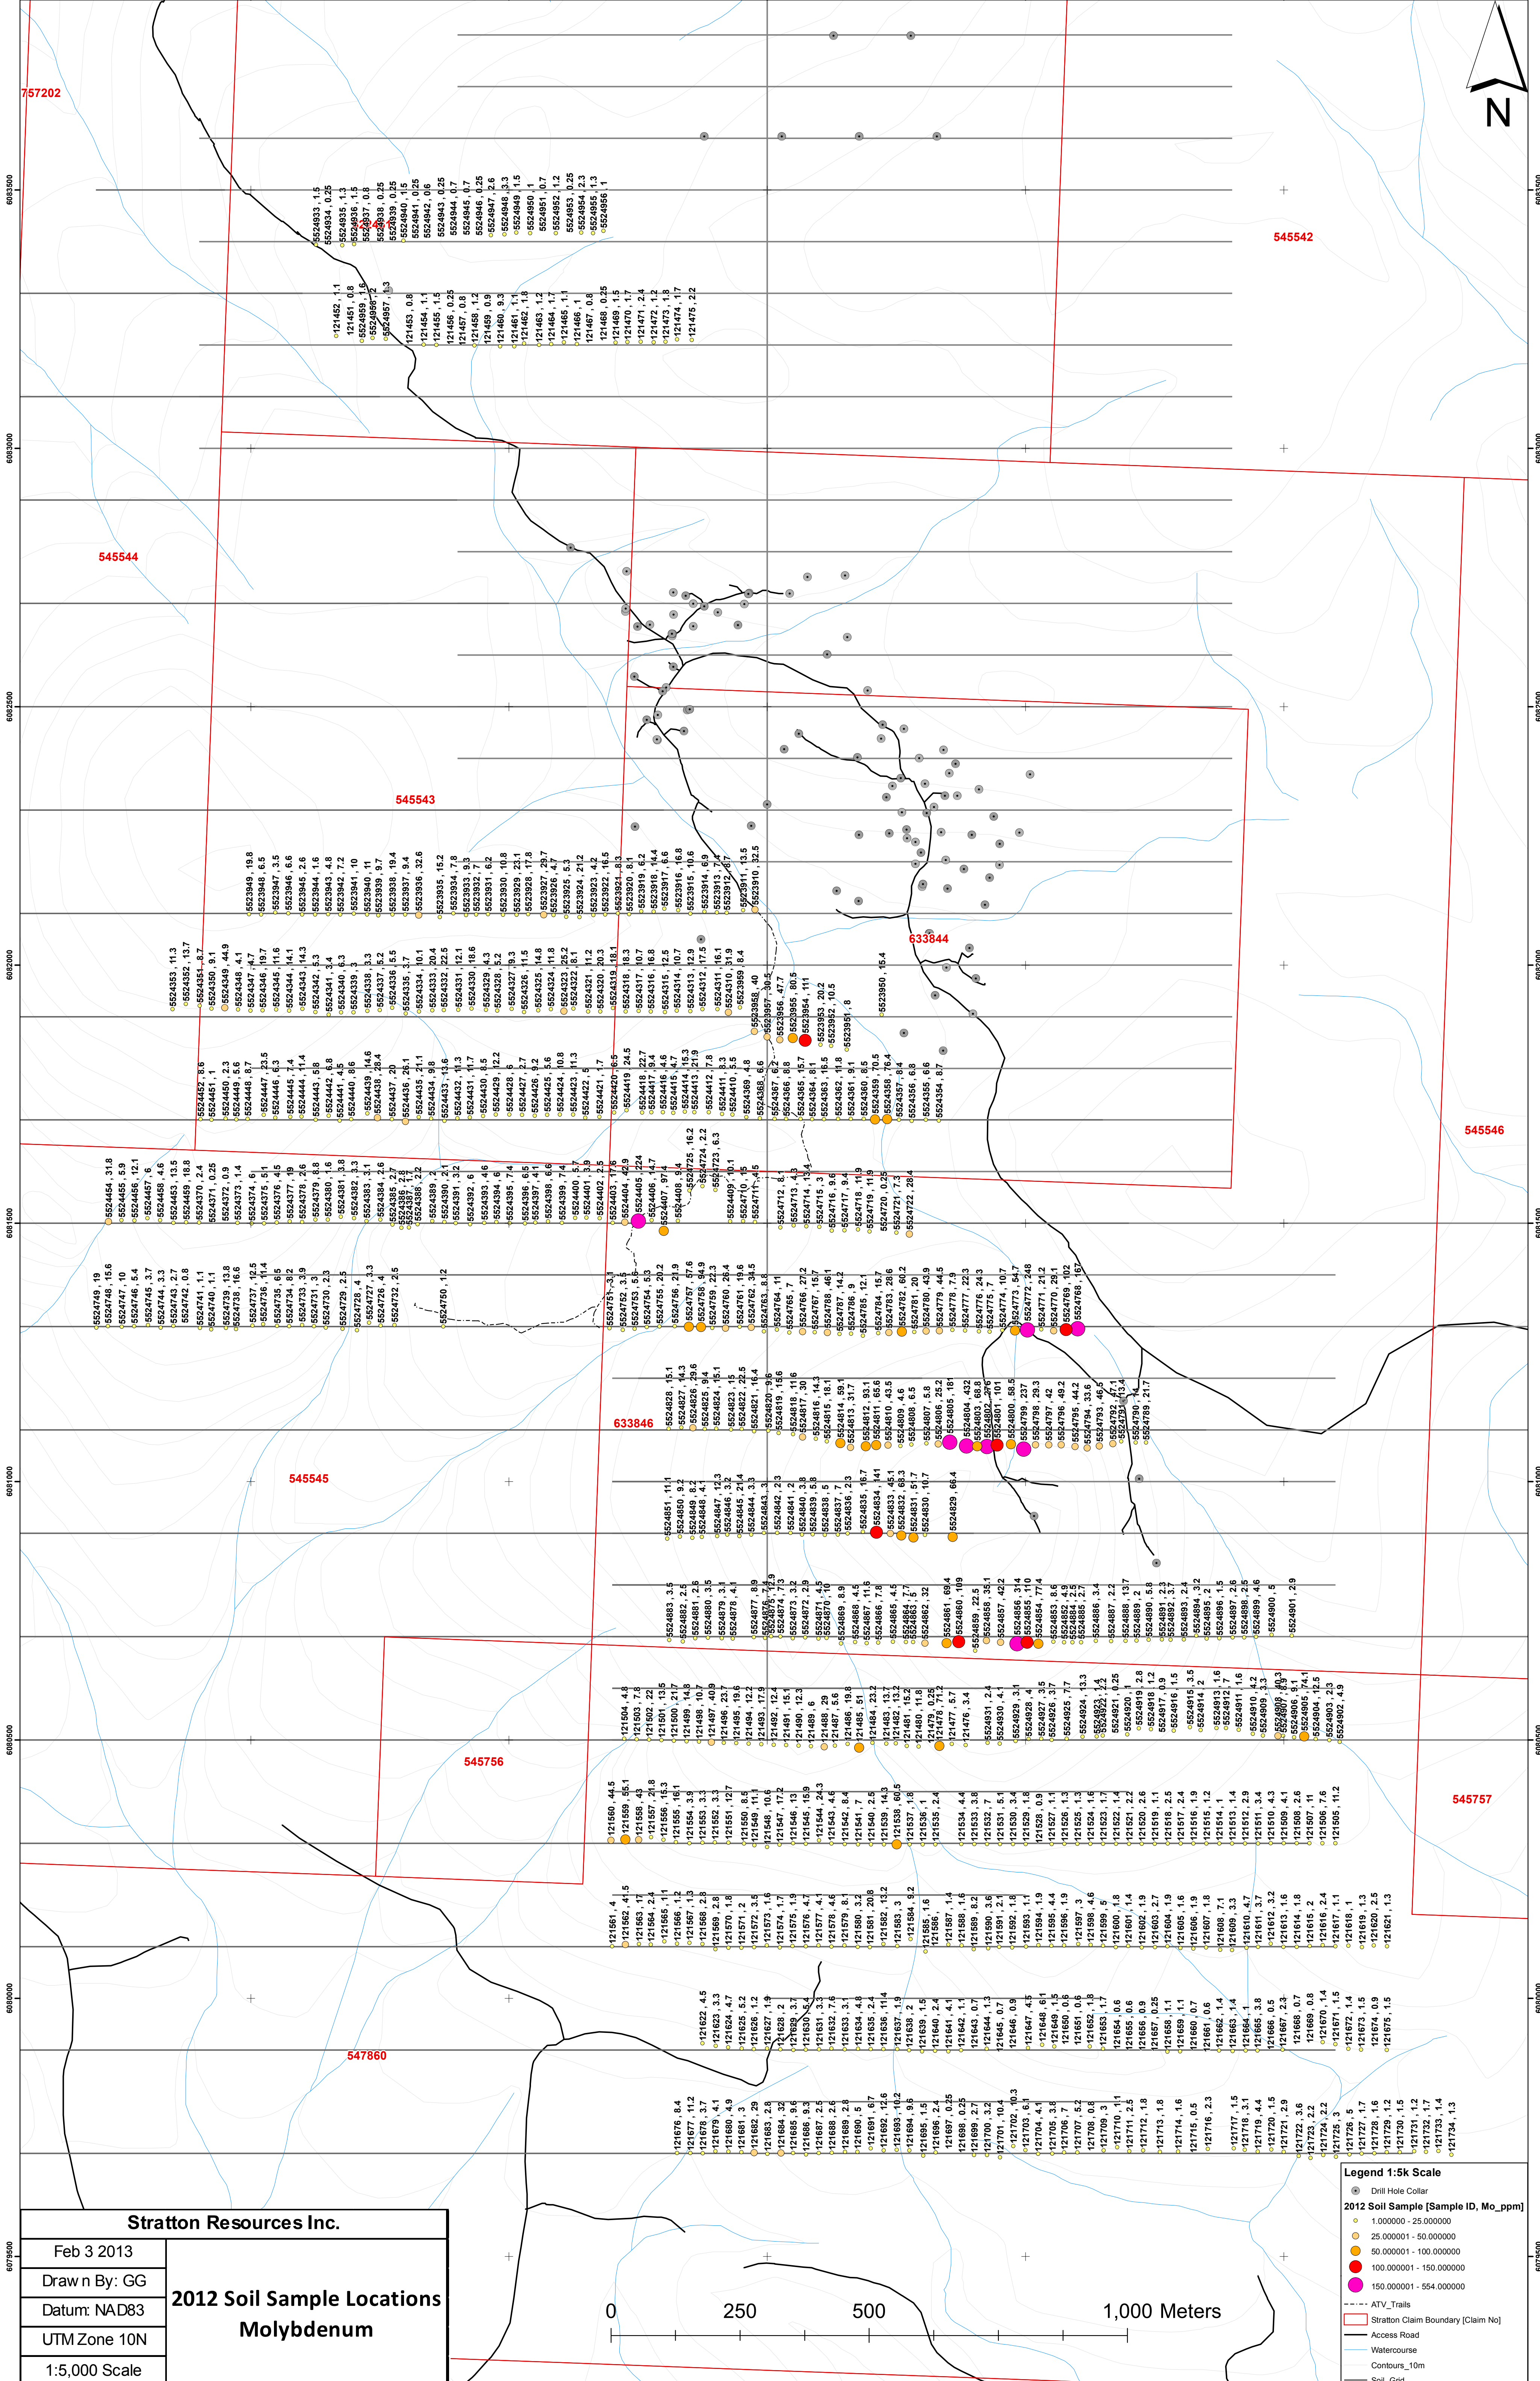

APPENDIX 4: SAMPLE MAPS

Stratton Resources Inc.	
Feb 3 2013	2012 Soil Sample Locations Copper
Draw n By: GG
