

Free-gold in Bona #1 sample (about 50x mag)

Below is a large boulder with an approximate 12" highly mineralized quartz vein running through it. What I found interesting is after a closer inspection I realized the host rock was also highly mineralized! Take a look at the pictures and associated videos

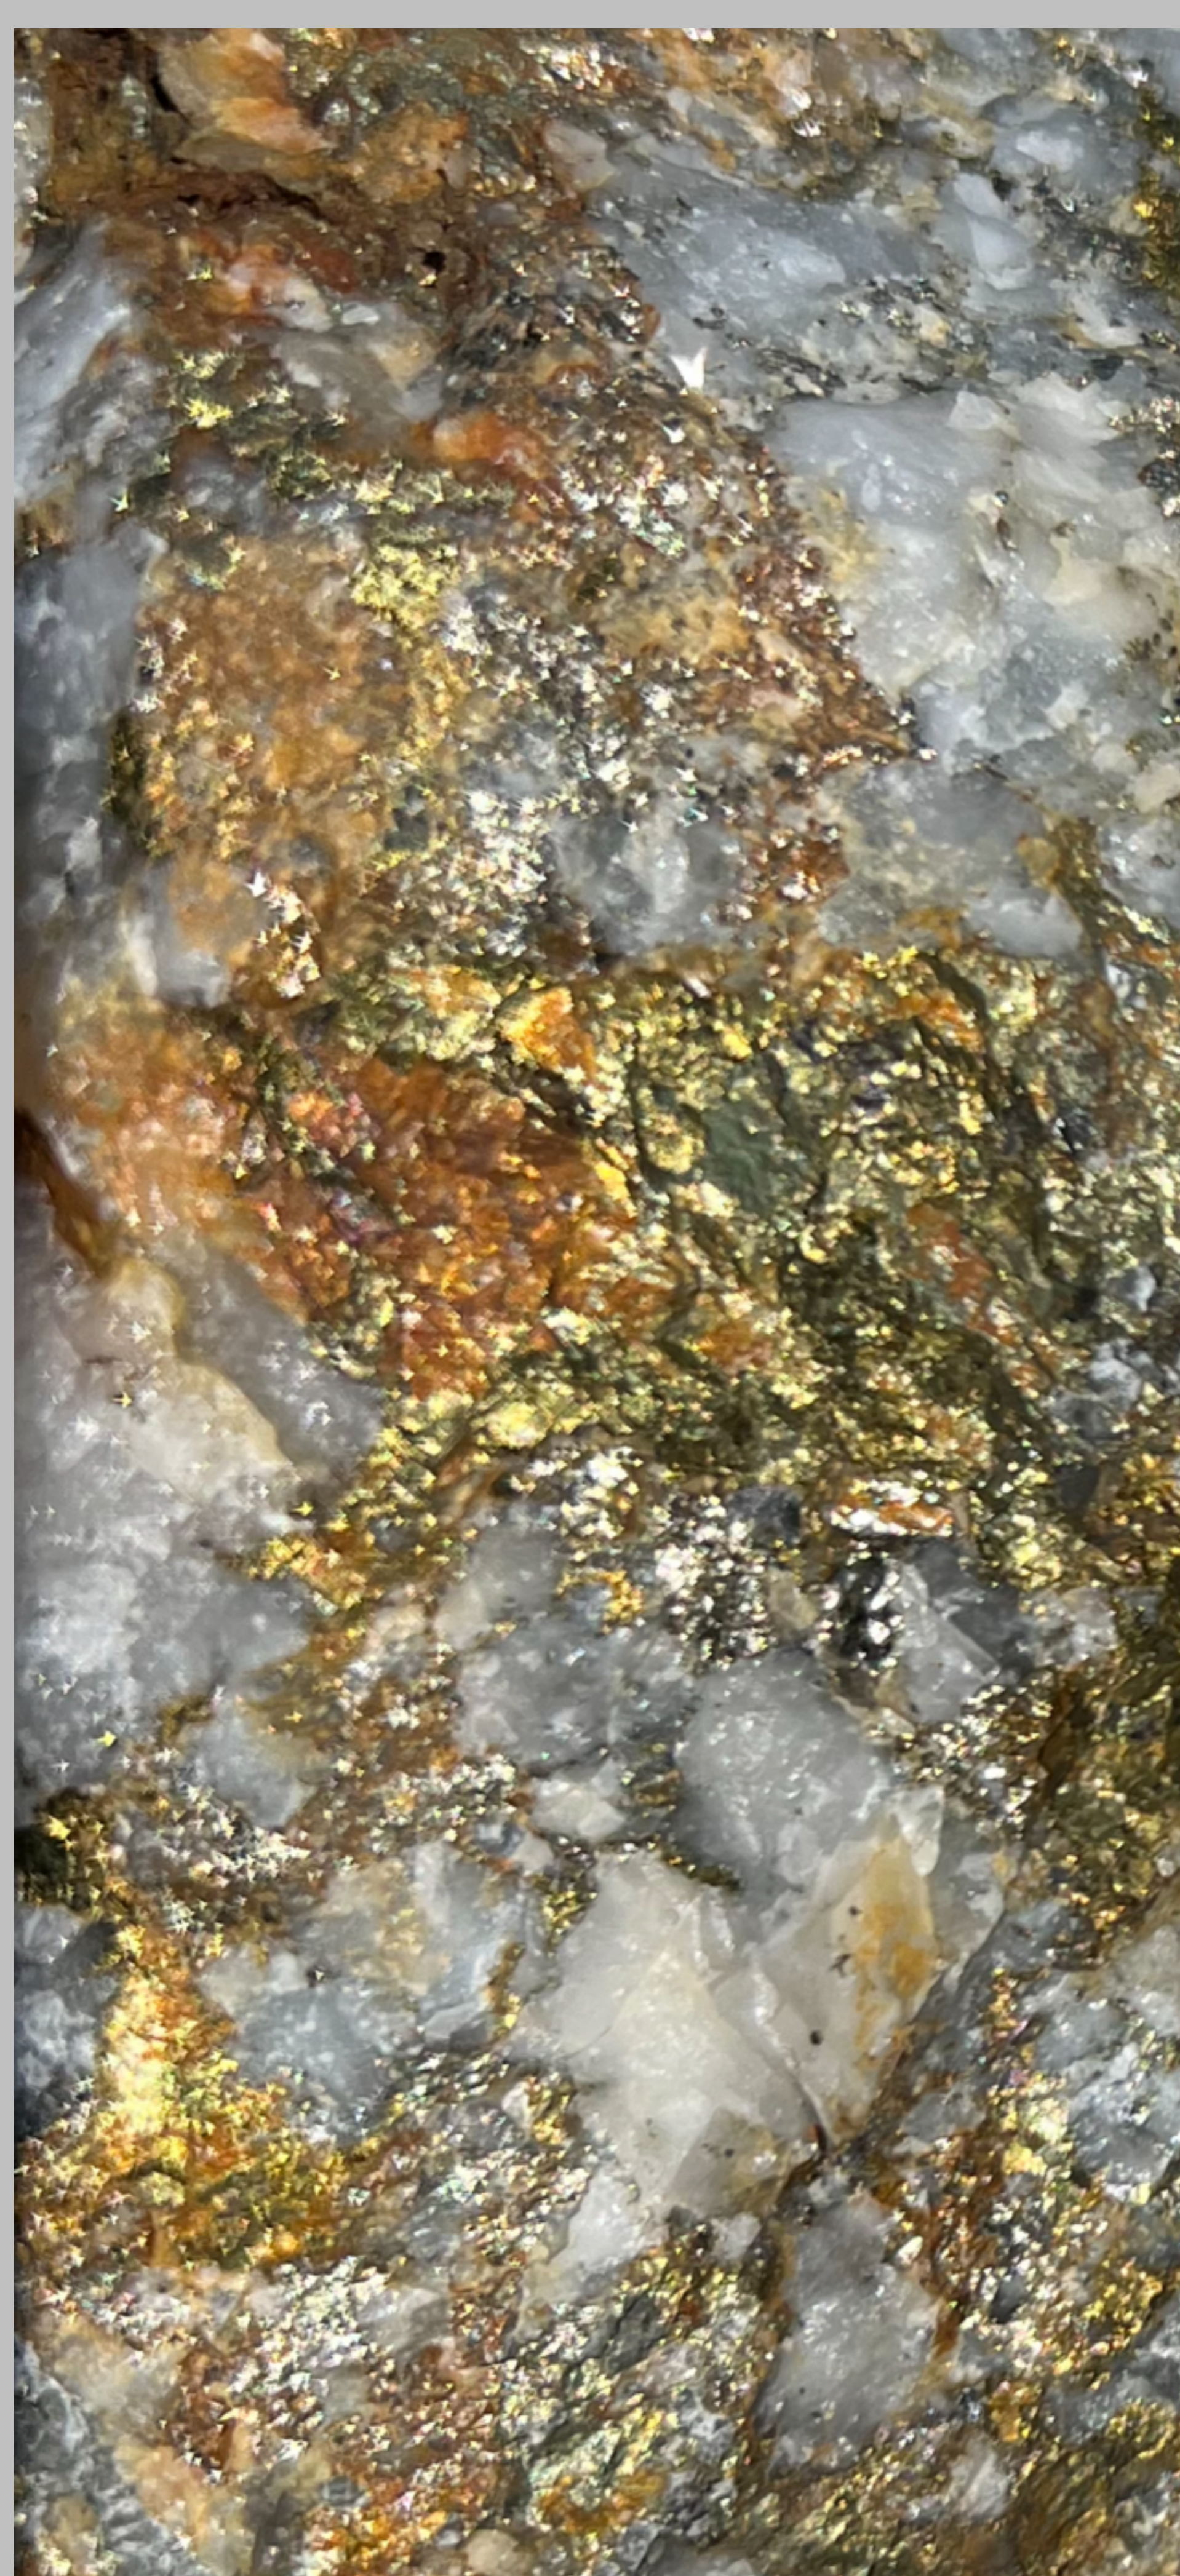

BONA BIG BOULDER (the mineralization in this is spectacular)

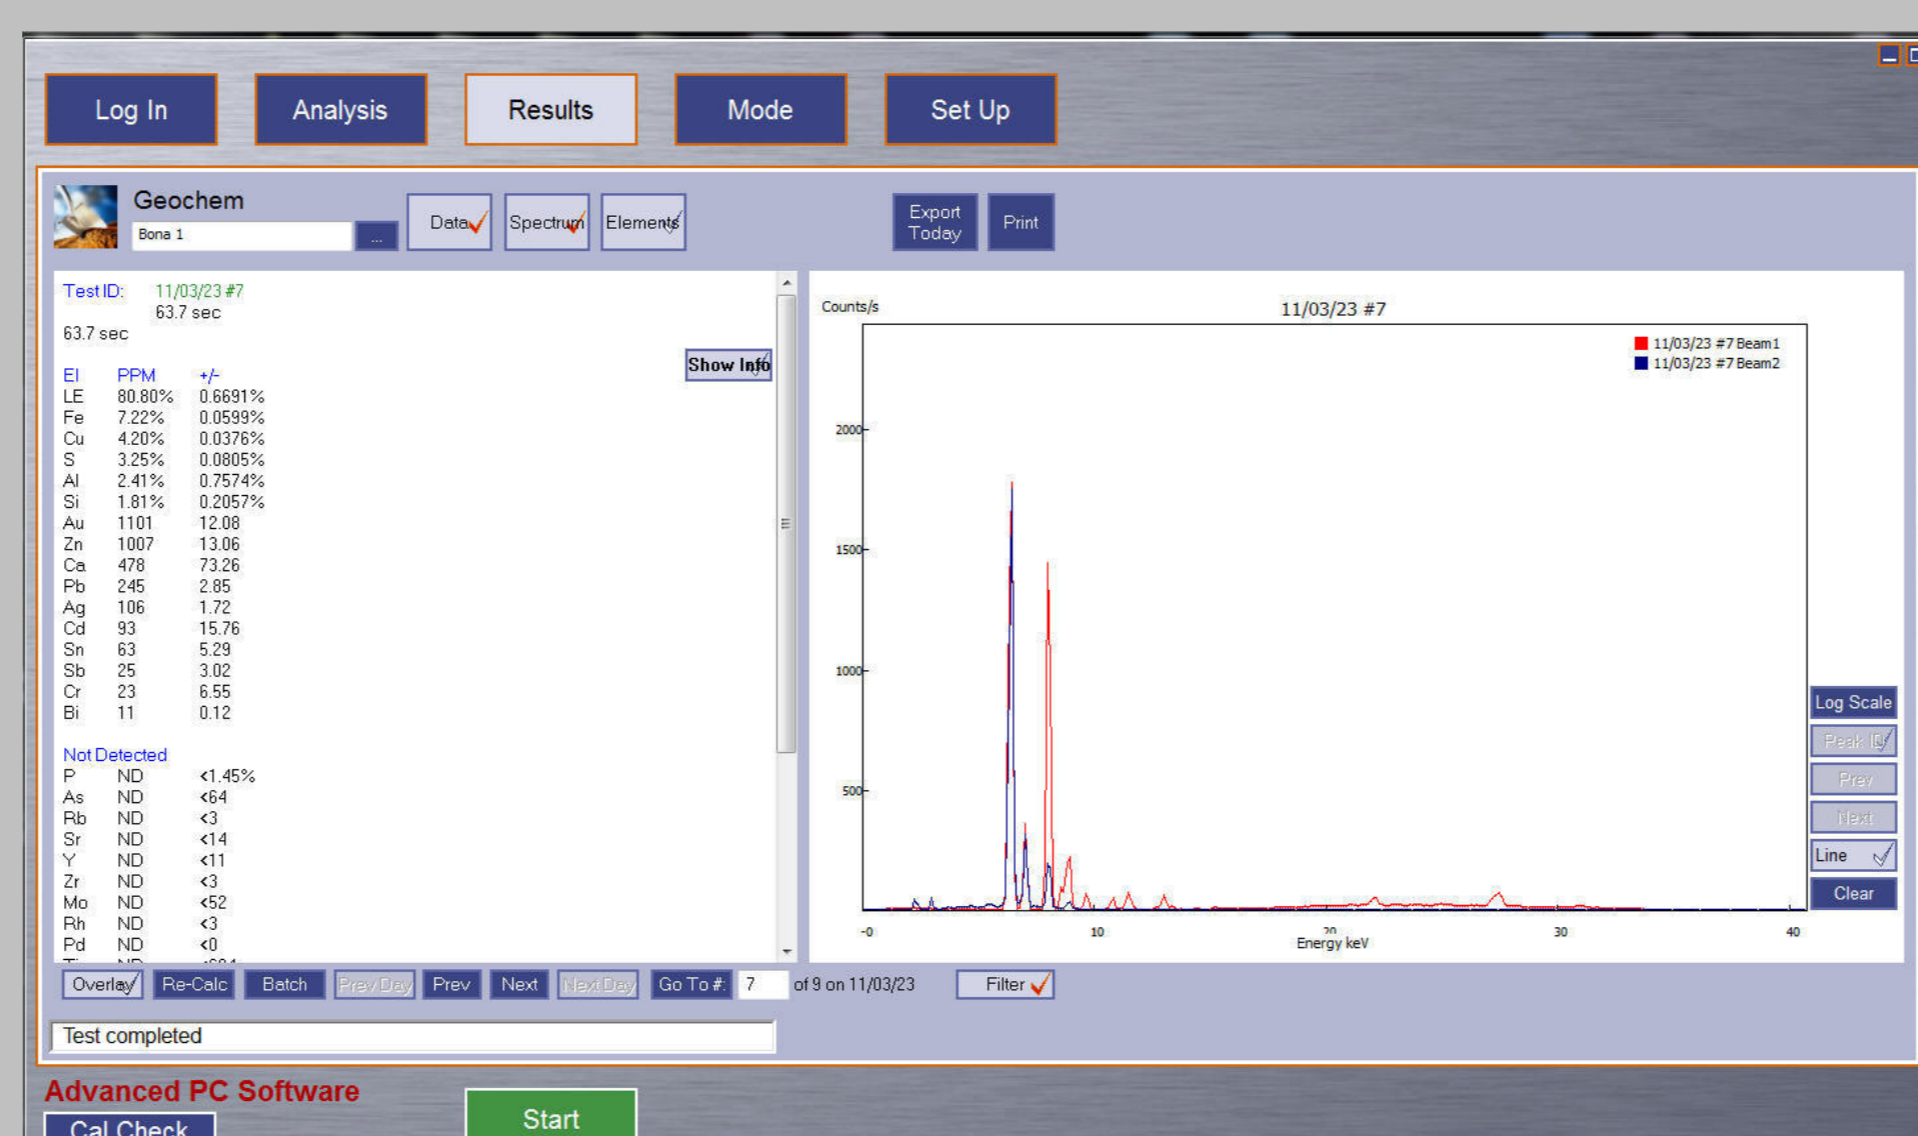

BONA BOULDER SIDE MINERALIZATION

SEE BONA BOULDER VIDEOS BELOW

Here are a few more pictures of the samples I brought back (around 200+lbs) on my last trip to Bonaparte.

In many cases within samples, you can visually see free-gold and confirm it with the XRF. Readings in excess 500 ppm Au to 1100 ppm Au and Cu in excess of 4% in the Bona 1 sample. (see below) are not uncommon
